Seung-Bok Choi, Inha University, Incheon, South Korea

Haibin Duan, Beijing University of Aeronautics and Astronautics, Beijing,  
P.R. China

Yili Fu, Harbin Institute of Technology, Harbin, P.R. China

Carlos Guardiola, Universitat Politècnica de València, València, Spain

Jian-Qiao Sun, University of California, Merced, USA

Springer Tracts in Mechanical Engineering (STME) publishes the latest developments in Mechanical Engineering - quickly, informally and with high quality. The intent is to cover all the main branches of mechanical engineering, both theoretical and applied, including:

- Engineering Design
- Machinery and Machine Elements
- Mechanical structures and stress analysis
- Automotive Engineering
- Engine Technology
- Aerospace Technology and Astronautics
- Nanotechnology and Microengineering
- Control, Robotics, Mechatronics
- MEMS
- Theoretical and Applied Mechanics
- Dynamical Systems, Control
- Fluids mechanics
- Engineering Thermodynamics, Heat and Mass Transfer
- Manufacturing
- Precision engineering, Instrumentation, Measurement
- Materials Engineering
- Tribology and surface technology

Within the scopes of the series are monographs, professional books or graduate textbooks, edited volumes as well as outstanding PhD theses and books purposely devoted to support education in mechanical engineering at graduate and post-graduate levels.

# Preface

This book is based on lecture notes for a postgraduate course at University of Southern Denmark (SDU). For us, the integrated teaching of stability and vibration justifies the efforts needed to join many different subjects in a presentation on the introductory level.

Basic understanding of the content of the course, named Stability and Vibration, can be obtained from the derived formulas and graphical presentations of numerical results that give an overview of parameter dependence. Students may reproduce these graphs with their personal MATLAB programs and obtain further results and a deeper insight. Formulas for instability modes and vibrational modes should be used to write interactive and dynamic programs to get a deeper insight into the subject of the course.

The chosen presentation to a large extent in non-dimensional quantities may at first seem disturbing, but it gives more generality and is hopefully appreciated after some time. It should be added that dimensional check of formulas is still possible.

A number of different notes written in Danish are behind this book. Critics of the present version and suggestions to improve the book are most welcome on email to [slp@iti.sdu.dk](mailto:slp@iti.sdu.dk).

# Contents

<b>1</b>	<b>Introduction</b>	<b>1</b>
<b>2</b>	<b>Beam-Column Differential Equation</b>	<b>5</b>
2.1	What Is a Beam-Column	5
2.2	Differential Equation for Static Equilibrium	7
2.3	Differential Equation for Eigenfrequencies	8
2.4	Names and Symbols for Boundary Conditions (BC)	10
<b>3</b>	<b>Eigen Solutions for the Euler Cases</b>	<b>13</b>
3.1	Boundary Conditions	13
3.2	How to Solve an Eigenvalue Problem	14
3.3	Instability Modes for the Euler Cases	14
3.3.1	Instability Mode for the Euler Case I	14
3.3.2	Instability Modes for the Euler Cases II–IV	15
3.3.3	Instability Mode for the Euler Case V	16
3.4	Eigenfrequency Modes for the Euler Cases	17
3.4.1	Eigenfrequency Modes for the Euler Case I	17
3.4.2	Eigenfrequency Modes for the Euler Cases II–VI	18
3.5	Summary	21
<b>4</b>	<b>Beam-Columns and Applied Berry Functions</b>	<b>23</b>
4.1	Model of Beam-Column	23
4.2	General Moment Loads	26
4.3	Elastic Support Against End Rotations	28
4.3.1	A Fixed Support as a Limiting Case	30
<b>5</b>	<b>Shear Beam Loads and Cantilever Beam-Columns</b>	<b>33</b>
5.1	Shear Loads on Beam-Columns	33
5.1.1	A Fixed Support as a Limiting Case	35
5.2	Cantilever Beam-Columns	36
5.2.1	Two Cantilever Cases	38

<b>6</b>	<b>Beam-Column Eigenfrequencies</b>	41
6.1	Mathematical Model for Different Physical Problems	41
6.2	Solution of DE (6.1) with BC (6.2)	42
6.3	Eigenfrequency as a Function of Conservative Axial Load	44
6.4	Rotational Spring Supports	45
6.4.1	Euler Cases as Limiting Cases	46
<b>7</b>	<b>Buckling with Spring Supported BC</b>	47
7.1	Mathematical Definition and Physical Experiments	47
7.2	Different Instability Formulations	48
7.3	Buckling with End Rotations	49
7.4	Buckling with End Translations	51
7.5	Buckling with Winkler Support	53
7.5.1	Eigenfrequencies with Winkler Support	57
<b>8</b>	<b>Eigenfrequencies of Beam-Columns with Spring Supported BC</b>	59
8.1	Eigenvalue Problems with Analytical Solution	59
8.2	Solving the Transcendental Equations	62
8.3	Explicit Solutions by Inverse Approach	63
8.3.1	Lowest Eigenfrequency as a Function of Support Stiffnesses, Assumed No Column Force	64
8.4	Alternative Function Expressions	64
8.5	Specific Graphically Presented Results, Obtained by the Newton–Raphson Method	66
8.5.1	Lowest Eigenfrequency as a Function of Column Force, with Support Stiffnesses as Parameters	68
8.5.2	Lowest Eigenfrequency as a Function of Column Force, Further BC Parameters	68
8.6	Lowest Eigenfrequency as a Function of Non-conservative “follower” Column Force	70
<b>9</b>	<b>Dynamic Stability Formulation</b>	73
9.1	One and Two Degrees of Freedom	73
9.2	An Elementary Beam-Column Case	74
9.3	Column with a Point Mass	77
9.4	An Improved Dynamic Column Model	80
9.5	Non-conservative Column Load	82
<b>10</b>	<b>Stability of 2D Frames</b>	85
10.1	Frames	85
10.2	Only One Beam-Column in the Frame	85
10.3	Several Beam-Columns in the Frame	87
10.4	Solution Procedure (“cookbook”)	89
10.5	Post-Critical Imperfection Analysis	91

<b>11 Buckling Stresses, Material Nonlinearity, and Beam Modeling</b>	95
11.1 Various Concepts	95
11.2 Maximum Stress in Beam-Columns	96
11.3 Material Nonlinearity	99
11.3.1 Different Suggested Formulas	99
11.3.2 Experiments and Safety Factor	100
11.3.3 Design Formulas Used in Truss Optimization	101
11.4 Improved Beam Modeling	102
11.4.1 Influence on Column Buckling	103
11.4.2 Modeling Conclusions	104
<b>12 Large Displacements, Pre-buckling Strains, and Snap-Through</b>	105
12.1 Large Displacements for the Elastica	105
12.2 Pre-buckling Strain and Modified Data	108
12.2.1 A Build Up Column	109
12.2.2 Notes on Global and Local Buckling and Vibrational Modes	111
12.3 Linear Elastic Snap-Through	112
<b>13 Dynamics of Discretized Linear Systems</b>	115
13.1 Discretization Continuous to Discrete	115
13.2 Dynamic Equilibrium	116
13.3 Non-damped, Free Vibrations	117
13.3.1 Real, Positive Eigenfrequencies	117
13.3.2 Orthogonal Eigenmodes	118
13.4 Expansion for More General Linear Systems	119
13.5 Vibrations with Single dof	120
13.5.1 Non-damped Single dof Vibrations	120
13.5.2 Damped Single dof Vibrations	121
<b>14 Discretized Stability Analysis</b>	123
14.1 Different Stiffness Matrices	123
14.2 Green-Lagrange Strain Model	124
14.2.1 Finite Element Equilibrium and the Secant Stiffness Matrix	125
14.2.2 Residuals and Newton–Raphson Iterations	126
14.2.3 The Stress Stiffness Matrix	126
14.2.4 The Tangent Stiffness Matrix for a Tetrahedron Element	127
14.3 Linear Bifurcation Buckling	128
14.3.1 Nonlinear Obtained Reference State	129

# Acronyms

Traditional notations are normally preferred. For non-dimensional quantities, the use of the Greek letters is preferred, but with exceptions as for non-dimensional boundary stiffnesses. For dimensional quantities, the use of the Latin letters is preferred. Matrix notation is used for linear algebra with [ ] for rectangular and quadratic matrices, { } for column matrices and { }<sup>T</sup> for row vectors, i.e., <sup>T</sup> as upper index for transpose.

## Notations

*Latin notations, mainly dimensional quantities*

$A$	Cross-sectional area
$A_{min}$	Minimum allowable cross-sectional area
$B, \bar{B}, \tilde{B}$	Berry functions
$C$	Lower index for critical quantity
$C, C_1, C_2, C_3, C_4$	Constants in a solution
$c$	Cross-sectional position for largest axial stress in (11.5)
$D$	Determinant and characteristic function
$D_1, D_2, D_3, D_4, D_5, D_6, D_7$	Sub-functions of $D$
$D, d$	Diameters of a circular cross section
$E, E_t, E_s, E_r$	Moduli of elasticity, specifically, Young's, tangent, secant, and reduced
$e$	Eccentricity length
$F$	Function for differentiation of finite integral in (2.4)
$f, f_{i,j}$	Flexibility components

$G$	Shear modulus of elasticity
$g$	Acceleration of gravity
$g, \bar{g}$	Parameters defined by (8.12)
$h$	Height
$I, i$	Cross-sectional moments of inertia
$i$	Imaginary unit = $\sqrt{-1}$
$K$	Stiffness for translational spring at boundary
$k, k_C$	Non-dimensional $K$ and critical value of this
$L, l$	Lengths of a beam
$\tilde{L}$	Deformed length of a bar
$l_e$	Effective length in buckling or in vibration
$M$	Moment, internal or external load
$M_0, M_1$	Moments at the boundary of a beam-column
$M_A, M_{AB}$	Moment at a point $A$ specifically of beam-column between $A, B$
$m$	Distributed moment per length
$N$	Axial column force, positive in tension
$N_C$	critical axial column force
$N_{AB}$	Axial column force in beam-column between $A, B$
$n$	Number, say 0, 1, 2,...
$n_C$	Number of buckles in critical state
$P, P_C$	Axial column compressive force, and critical value of this
$P_p$	Compressive force resulting in compressive stress $\sigma_p$
$p$	Volume force
$P(z), \tilde{P}(z)$	Complex polynomial and its conjugated, see (15.18)
$Q(z)$	Real coefficient part of a complex polynomial
$R(z)$	Imaginary coefficient part of a complex polynomial
$Q$	Beam external force in transverse direction
$q$	Distributed beam external force in transverse direction per length
$r$	Stiffness per length
$S_0, S_1$	Stiffness for rotational springs at boundary ends 0, 1
$s_0, s_1$	Non-dimensional $S_0, S_1$
$s, s_{ij}$	Stiffness components
$(s_0)_C$	Critical non-dimensional stiffness at 0
$s$	Length position at a curved beam-column
$T$	Internal shear force for a beam-column
$T_0, T_1$	Shear forces at boundary ends 0 and 1
$t$	Time parameter
$x$	Position parameter in the length direction of a beam-column

$y$	Displacement in the transverse direction, see Fig. 2.1, i.e., $y = y(x)$
$z$	Polynomial complex parameter

*Greek notations, mainly non-dimensional quantities*

$\alpha$	Stability parameter in the exponential time function $e^{(\alpha + i\omega)t}$
$\alpha$	Factor in trigonometric functions
$\alpha$	Value of angle in theastica
$\alpha$	Parameter defined by (6.7)
$\beta$	Parameter defined by (6.7)
$\Gamma$	Slenderness ratio
$\gamma$	Parameter for non-conservative load
$\gamma$	Shear strain
$\Delta$	Small but finite incrementation prefix
$\delta$	Virtual prefix
$\delta$	Displacement at a specific point
$\partial$	Partial prefix
$\varepsilon_{i,j}$	Strain component
$\varepsilon, \varepsilon_C$	Axial strain and critical value of this
$\zeta$	Factor in (9.21) for mass moment of inertia
$\eta$	Non-dimensional position parameter for load
$\eta_{i,j}$	Green-Lagrange strain component
$\theta$	Angle of cross-sectional rotation (radians positive anticlockwise)
$\theta_0, \theta_1$	Angles for end rotation at 0 and 1
$\kappa$	Curvature of a beam
$\Lambda$	Modified eigenvalue in (11.25)
$\lambda, \bar{\lambda}, \lambda_C$	Non-dimensional column loads and critical value
$\mu$	Cross-sectional parameter for maximum shear stress
$\mu_E$	Factor of safety in the Euler range
$\nu$	Poisson's ratio
$\xi, \bar{\xi}$	Non-dimensional position parameter $\xi = x/L$ and specifically integration parameter
$\rho$	Density parameter
$\rho$	Non-dimensional inertia radius
$\sigma_{i,j}$	Stress component
$\sigma, \sigma_C$	Axial stress and critical value of this
$\sigma_p$	Compressive stress at proportionality limit
$\sigma_y$	Compressive yield stress
$\tau$	Shear stress
$\phi, \phi_C$	Non-dimensional squared eigenfrequency and its critical value

$\phi$	Non-dimensional for magnetic attraction or for Winkler support
$\phi, \psi$	Angles in frame examples
$\omega^2, \omega_C^2$	Squared eigenfrequency and its critical value

*Matrix notations, mainly for numerical formulations*

$\{A\}, \{\tilde{A}\}$	Static and dynamic load vector
$[B_t]$	Strain–displacement relation
$[C]$	Damping matrix, with damping coefficients $c_{i,j}$
$\{D\}, \{\tilde{D}\}$	Static and dynamic displacement vector
$\{\Delta_r\}$	Eigen vector for mode $r$
$[F]$	Flexibility matrix, with flexibility coefficients $f_{i,j}$
$[L_s]$	Constitutive secant matrix, with coefficients $(l_{i,j}), s$
$[L_t]$	Constitutive tangent matrix, with coefficients $(l_{i,j}), t$
$[M]$	Mass matrix, with mass coefficients $m_{i,j}$
$\{0\}$	Null vector, where all component are zero
$\{R\}$	Residual vector, for Newton–Raphson iterations
$[S]$	Stiffness matrix, with stiffness coefficients $s_{i,j}$
$[S_0]$	Initial stiffness matrix for linear elasticity
$[S_s]$	Secant stiffness matrix
$[S_\gamma]$	Displacement gradient stiffness matrix
$[S_\sigma]$	Stress stiffness matrix
$[S_t]$	Tangent stiffness matrix $[S_\gamma] + [S_\sigma]$

*Special symbols and abbreviations*

BC	Boundary Condition(s)
DE	Differential Equation(s)
dof	Degree of freedom
FE	Finite Element (method)
$d$	Prefix for differential
$\prime$	Partial differentiation with respect to non-dimensional position coordinate
$\cdot$	Partial differentiation with respect to time
$  $	Determinant or norm value
$:=$	By definition
$\sim$	Indicate dynamic dependence or alternative quantity

# Chapter 1

## Introduction

This small book covers the subjects of stability, of vibration, and of dynamic stability, in the first chapters restricted to 2D beam problems. The book is written for a course named stability and vibration, and the intention is to communicate the similarities and interactions of the three subjects that are more traditionally treated separately.

Another non-traditional aspect is the focus on spring supports with graphical results to clearly understand the importance of support modeling. Initial analysis of continuous models is performed by a solution of differential equations, but with finite element (FE) analysis, the generality is rather unlimited.

### Why this book?

A larger number of books are written on stability, and an even larger number are written on vibration. References to such books are listed in the list of references at the end of the present book. The two practical important subjects of stability and vibration are seldom treated as an integrated subject, although closely related. The book by Ziegler (1968) is well suited for teaching advanced subjects and contains a clear classification of our different physical problems. The book by Panovko and Gubanov (1964) supports the good tradition of studying very simplified models of physical problems, in order to focus on the behavior in question. A recent book on advanced vibrations and stability theory is by Thomsen (2003). This book focuses on nonlinear theory with chaos theory and special high-frequency effects.

### Equal focus on stability and vibration

To integrate stability and vibration on the introductory level is a primary goal of the present book. A second goal of the book is to focus also on non-classical boundary cases for beam problems, i.e., to extend the cases termed Euler cases. Linear elastic rotational springs as well as translational springs are modeled from an analytical point of view by extended use of well-known functions, and the support spring stiffnesses are treated as parameters. From this analysis, a number of functional relations are obtained:

### Extension to linear elastic supports

- Stability as a function of boundary conditions (BC)
- Eigenfrequency as a function of BC.
- Eigenfrequency as a function of column force.

### Graphical result display

The intention is to graphical display such results, often obtained by explicit expressions. The book is not an alternative to the many written books, but should be seen as a supplement to these.

It is the intention, generally to let these graphical displays dominate, not for reading specific numerical values from the graph but to illustrate the principal relations between stability (column force), eigenfrequency (with focus on the lowest one), and the parameters of the boundary conditions (BC). Computer tools make this possible and influence the final look of the book, hopefully liked by the readers.

### Chosen notations and sign

Traditional notations are normally preferred, as seen in the list of symbols. For non-dimensional quantities, the use of the Greek letters is preferred, but with exceptions as for non-dimensional boundary stiffnesses. For dimensional quantities, the use of the Latin letters is preferred. Matrix notation is used for linear algebra with  $[ ]$  for rectangular and quadratic matrices,  $\{ \}$  for column matrices and  $\{ \}^T$  for row vectors, i.e.,  $T$  as upper index for transpose.

Sign decision is in the direction of the axes of a Cartesian coordinate system, for moments (rotations) as well as for forces (displacements). The book is for the continuous models mainly limited to 2D problems and thus moment (rotation) is chosen anticlockwise.

### 2D-beam-columns

The initial part of the book is analytical oriented with a focus on beam-columns. Later, the general formulation is related to finite element (FE) models, and the structural or continuum models are then generalized.

### Finite element models

A structure/continuum may be described by system matrices like mass matrix  $[M]$ , stiffness matrix  $[S]$ , and stress stiffness matrix  $[S_\sigma]$ . Then, in addition to analysis also synthesis aspects can be involved, such as design for vibration and stability. This includes sensitivity analysis that is determination of response gradients as a function of design parameters.

### Design for stability/vibration

Additional insight into the subject of stability as well as that of vibration is hopefully obtained by the integrated treatment. It is the intention that each formula should to a large extent be derived to convince the students and other readers.
