Preface

William Cartwright, Michael P. Peterson and Georg Gartner

Multimedia Cartography Edition 2 has been produced as a 'companion' title to the First Edition. This book includes some of the chapters from the First Edition, with 26 new chapters. These cover dynamic map generation via the Internet, Internet Atlas publishing, 3D (realistic and non-realistic) and the application of games tools as geographical visualization realisation and presentation techniques. It also addresses the issues of accessibility, privacy & security and user-centred design.

This second edition of *Multimedia Cartography* includes updated applications areas that are Internet and mobile mapping-focussed. Since the release of Edition 1 in 1999 the focus of the delivery of Multimedia Cartography applications now includes the World Wide Web and mobile services, as well as discrete media. New chapters in the book reflect this. As per the first edition, this book has been written to provide foundation materials for those beginning in Multimedia Cartography production and design. It also provides chapters on current and developing applications that will interest academic and professionals alike. These chapters have been included to illustrate the broad-ranging applications that comprise Multimedia Cartography – discrete, distributed and Mobile. The book is pertinent to both the mapping sciences and related geographical fields.

The first section of the book covers the 'essential' elements of Multimedia Cartography. This section elaborates on the theoretical ideas about Multimedia Cartography and the essential elements that make it unique from computer-assisted cartography and visualization. The following section covers applications of Multimedia Cartography – discrete, distributed and mobile. In each of these areas theory, design concepts and production tools are covered. Several chapters focus on how multimedia is used to author the product and the design and production considerations that need to be addressed when undertaking production of these artefacts. This section provides examples of products delivered on CD-ROM, via the Internet, using Location Based Services (LBS), 3D, Virtual Reality and Computer Games tools. The final section looks at a number of issues that relate to Multimedia Cartography and the possible applications of this new rich media. The penultimate chapter addresses future directions and applications of Multimedia Cartography.

Like edition 1, this book has again been an international effort, with contributing authors from many countries, and editors based on three continents. Contributing authors are involved in Multimedia Cartography applications as practitioners, researchers and academics. The diverse nature of the backgrounds of the contributing authors and a global outlook about what Multimedia Cartography 'is' that

they provide, gives a unique vehicle for conveying contemporary thinking and practice related to Multimedia Cartography.

We commend and value the efforts that contributing authors have made to this collaborative effort. We believe that the contents of the book provide a resource for those who are moving into Multimedia Cartography, as well as experienced readers. We hope that *Multimedia Cartography* Edition 2 becomes a valuable addition to your bookshelf.

William Cartwright, Melbourne, Australia
Michael P. Peterson, Omaha, USA
Georg Gartner, Vienna, Austria

Contents

1 Multimedia Cartography	1
1.1 Introduction	1
1.2 Visualizing geography	2
1.3 Access to geographical information	3
1.4 A Different map	4
1.5 Multimedia as an information interface	5
1.6 Visualizing Multimedia Cartography	6
1.7 About this book	9
2 Development of Multimedia	11
2.1 Introduction	11
2.2 In the beginning ...	12
2.3 Pre-electronic multimedia	12
2.3.1 Microfiche	13
2.3.2 Motion film and interactive cinema	13
2.3.3 Video	13
2.3.4 Videodisc	15
2.4 Hypertext	16
2.5 Hypermedia and Multimedia	17
2.5.1 Hypermedia	17
2.5.2 Multimedia	18
2.5.3 Discrete Multimedia – CD-ROM <i>et al.</i>	19
2.5.4 DVD	20
2.5.5 Games machines	21
2.6 Hypermaps	22
2.7 Multimedia and maps	23
2.7.1 Initial projects	23
2.7.2 Videodiscs and Cartography	24
2.7.3 Cartographic products on CD-ROM	25
2.7.4 Games, maps and gameplay	26
2.8 From packaged media to distributed media	27
2.9 Conclusion	29
3 The Internet and Multimedia Cartography	35
3.1 Introduction	35
3.2 Internet development	35
3.3 Maps and the Internet	37
3.4 Internet use and Internet map use	37
3.5 Research in Internet Cartography	42
3.6 Theory to support Internet Cartography	42
3.6.1 Dimensions of internet map use	42
3.6.2 Internet map delivery	43

3.6.3	Internet multimedia mapping	45
3.6.4	Internet mobile mapping	47
3.6.5	Theoretical development	47
3.7	Summary and suggestions	48
4	Development of Multimedia - Mobile and Ubiquitous	51
4.1	Introduction	51
4.2	Elements of Cartographic LBS	51
4.2.1	Positioning	52
4.2.2	Modelling and Presentation of Information	53
4.2.3	Users and Adaptation	55
4.3	Infrastructure Developments: Towards ubiquitous environments	56
4.3.1	National telecommunication infrastructure	56
4.3.2	Electronic Paper	57
4.4	Navigation Systems as possible applications of LBS	58
4.5	Conclusion	61
5	Elements of Multimedia Cartography	63
5.1	Introduction	63
5.2	The Meaning of Multimedia Cartography	64
5.2.1	Maps, Lies and Abstraction	64
5.2.2	Maps and Amusement	65
5.3	The Paradigm of Multimedia Cartography	65
5.4	Elements of the Multimedia Cartography Paradigm	67
5.5.1	Inadequacy of the Paper Medium	68
5.5.2	Problems Associated with Distributing Maps on Paper	68
5.5.3	Problems in Map Use	69
5.5.4	The Intrinsic Value of Multimedia	69
5.5.5	The Moral Obligation of Cartographic Communication	71
5.5	Conclusion	71
6	Designing Suitable Cartographic Multimedia Presentations	75
6.1	Introduction	75
6.2	Media functions and media as artefact	75
6.3	Functions of media in information perception	76
6.4	Functions of media in knowledge generation	77
6.4.1	Cognitive approach	77
6.4.2	Approach of Erkenntnis theory	79
6.4.3	Didactic approach	80
6.5	Functions of media according to the purpose of	81

communication	
6.6 Media as artefacts	83
6.7 Conclusion	85
7 Design of Multimedia Mapping Products	89
7.1 Introduction	89
7.1.1 Concepts of Map-Based Access	90
7.1.2 Presentation and Structure Characteristics of the Multimedia Environment	90
7.1.2.1 The Hypermedia Paradigm	91
7.2 Components and Design of Multimedia Map-Based Products	92
7.2.1 The Multimedia Map-Based Product GUI	92
7.2.1.1 The Map as a Display and Product Control Construct	93
7.2.1.2 Symbol Objects	95
7.2.1.3 Marginalia – A Concept Extended	98
7.2.2 The Multimedia Content-Set	100
7.2.3 Object Links and Organisational Structures	100
7.3 Conclusion	101
8 Map Concepts in Multimedia Products	105
8.1 Introduction	105
8.2 General Map- and Atlas-related Concepts	106
8.3 Conclusion	114
9 Territorial Evolution of Canada - An Interactive Multimedia Cartographic Presentation	117
9.1 Introduction	117
9.2 Background of Product Development	118
9.3 Example of an Interactive Multimedia Presentation	119
9.3.1 Thematic Content	120
9.3.2 Cartographic Design Issues	121
9.3.3 Authoring Tools	122
9.3.4 Graphical User Interface	123
9.3.5 Operation	124
9.3.6 Design Considerations	124
9.4 The Internet Implementation	125
9.5 Conclusions	126
10 Wula Na Lnuwe’kati: A Digital Multimedia Atlas	129
10.1 Introduction	129

10.2 Target Audience	129
10.3 Selection of Chapters	130
10.4 Software	131
10.5 Production of Base Maps	131
10.5.1 Scanning	131
10.5.2 Tracing	131
10.5.3 Textures	131
10.5.4 Compilation	132
10.6 Media Choices	132
10.6.1 Maps	132
10.6.2 Typography	134
10.6.3 Imagery	134
10.6.4 Audio	134
10.6.5 Video	135
10.6.6 Atlas Interactivity	135
10.7 Conclusions	136
11 The Atlas of Canada – User Centred Development	139
11.1 An Evolution in Mapping	139
11.2 User Centred Development and Design	141
11.3 The Value of the User Centred Design Process	147
11.4 Case Studies	148
11.4.1 Case Study 1 – Mapping User Interface Design	148
11.4.2 Case Study 2 – Mapping User Interface Tools	151
11.4.3 Case Study 3 – Integration of Topographic Maps in the Atlas of Canada	154
11.5 Conclusion	158
12 <i>Atlas of Switzerland 2</i> A highly interactive thematic national atlas	161
12.1 Introduction	161
12.2 Brief history of the <i>Atlas of Switzerland</i>	162
12.3 Basic concepts and other thoughts	164
12.3.1 GIS in Multimedia	164
12.3.2 Adaptive Map	165
12.3.3 Graphical User Interface	166
12.3.4 3D Thinking	167
12.4 Organisation and implementation	168
12.4.1 Project organisation	169
12.4.2 Project setup and management	169
12.4.3 Editorial workflow and prototyping	170

12.4.4 Technical implementation	171
12.5 The 2D world: maps are beautiful	172
12.5.1 The adaptive map	173
12.5.2 The atlas ‘tool kit’	173
12.5.3 Topics	175
12.6 Switzerland in 3D	176
12.6.1 Visualization and analysis	176
12.6.2 Navigation	178
12.7 Conclusions and outlook	180
13 AIS-Austria – An Atlas Information System of Austria	183
13.1 General Overview	183
13.2 AIS-Austria Concept	185
13.3 AIS-Austria Requirements	186
13.4 AIS-Austria Functionality	188
13.5 AIS-Austria System Structure	191
13.5.1 Visualisation environment	191
13.5.2 Geodatabase	192
13.5.3 Spatial analysis	193
13.5.4 System interpreter	193
13.6 Conclusion and Outlook	193
14 Toward a New Generation of Community Atlases – <i>The Cybercartographic Atlas of Antarctica</i>	195
14.1 Introduction	195
14.2 The <i>Cybercartographic Atlas of Antarctica</i> Project	197
14.3 Atlas design: modularity and interoperability	198
14.4 The atlas development framework	202
14.5 The Atlas from the end user’s perspective	205
14.6 Discussion/conclusion: opening the atlas	212
14.7 Acknowledgements	213
15 The Employment of 3D in Cartography - An Overview	217
15.1 Introduction	217
15.2 Perceptive/Cognitive Aspects	218
15.3 Technical Aspects	221
15.3.1 User Interfaces	222
15.3.2 Software-Based Aspects	224
15.3.3 Communication Model Creation	226
15.4 Conclusion	226
16 Non-Photorealistic 3D Geovisualization	229
16.1 Background and Motivation	229

16.2 Photorealism and Its Limitations for Geovisualization	229
16.3 Non-Photorealistic Computer Graphics	231
16.3.1 Edge Enhancement	232
16.3.2 Non-Photorealistic Illumination	233
16.3.3 Non-Photorealistic Shading	234
16.4 Non-Photorealistic Terrain Illustration	235
16.5 Non-Photorealistic City Model Illustration	236
16.6 Conclusions	238
17 Real-Time Virtual Landscapes	241
17.1 Potentials, Limitations, and Challenges	241
17.2 3D Landscape Models	242
17.3 Functionality of Real-Time Virtual Landscape Systems	243
17.3.1 General System Architecture	244
17.4 Building Blocks of Virtual Landscapes	245
17.5 3D Building Modeling	246
17.6 3D Vegetation Modeling	247
17.6.1 3D Plant Modeling	247
17.6.2 3D Vegetation Modeling	247
17.7 Real-Time Landscape Rendering Techniques	249
17.8 Navigating Through Virtual Landscapes	249
17.9 Case Study: The Lost Italian Gardens	251
17.10 Conclusions	251
18 Digital Globes	255
8.1 Introduction	255
18.2 Categories of Digital Globes	255
18.3 What makes Digital Globes superior?	257
18.4 How suitable is a theme for a digital globe?	259
18.5 Examples of Digital Globes	260
18.5.1 Digital globe illustrations	260
18.5.2 Virtual hyperglobes	260
18.5.3 Tactile hyperglobes	262
18.6 Hologlobes	264
18.7 Conclusion	265
19 Augmented Reality as a Medium for Cartography	267
19.1 Introduction	267
19.2 Augmented Reality technology	269
19.3 Augmented reality visualization	273
19.4 Case study: Augmented map system	274
19.5 Mobile Augmented Reality	276
19.6 Case Study: <i>Signpost</i>	277

19.7 Conclusion	279
20 Virtual Reality in Urban Planning and Design	283
20.1 Introduction	283
20.2 A User focus, not technology lead	284
20.3 Town Planning in Australia	284
20.4 Pressures for Change	285
20.5 Towards a 3D Planning Scheme	287
20.6 Modelling and Simulation: oh....and games	288
20.7 RMIT approach to (ever) larger scale visualisations	289
20.7.1 Scale and resolution : single precision arithmetic	289
20.7.2 Performance & interactive use of data	289
20.7.3 Configuration and management: scene complexity and data organisation	290
20.7.4 Future-proofing?	290
20.8 Parallel Developments	291
20.9 Directions	291
20.10 Conclusion	293
21 Education and E-Learning with Virtual Landscapes	295
21.1 Introduction	295
21.2 Related Work	296
21.3 Background on Constructionist Learning	298
21.4 Interactivity and Interaction	300
21.5 3D Representation	301
21.6 The concept of virtual landscapes	303
21.7 An example scenario for the virtual landscape	304
21.8 Fundamentals for delivery and presentation of virtual Landscape	306
21.9 The prototype of the virtual landscape	307
21.10 Future developments	310
21.11 Conclusion	312
22 Cartography and the use of animation	317
22.1 Introduction - Why cartographic animation?	317
22.2 Spatial data and the type animations	318
22.3 Cartographic animation environment and visualization strategies	322
22.4 Conclusions	325
23 Multimodal Analytical Visualisation of Spatio-Temporal Data	327
23.1 Introduction	327

23.2 Visualisation of Spatial Time-Series in Computer Cartography and Statistical Graphics	329
23.3 Visualisation of Local Behaviours	330
23.4 Combining Tools for Behaviour Exploration	334
23.4.1 Getting the General Picture of the Behaviour on the Entire Territory	334
23.4.2 Finding Spatial Patterns of Similar Local Behaviours	337
23.4.3 Detecting Spatio-Temporal Patterns of Similar Changes	341
23.5 Discussion and Conclusions	343
24 Games and Geography	347
24.1 Introduction	347
24.2 What is a game?	347
24.2.1 Defining Games and Game-Style Interaction	347
24.3. Cultural Geography Place and Games	350
24.4. Games Involving Geography	351
24.4.1 Strategy-based Games	351
24.4.2 Fact-based Memory Games	351
24.4.3 Explorative Games	352
24.4.4 Affordance and Constraint-based Games	352
24.4.5 Place-Fed games	352
24.4.6 World Building games	353
24.5. Game Issues	353
24.5.1 Games and Learning	353
24.5.2 Navigation Issues in Games and Digital Environments	354
24.5.3 Evaluation Issues	354
24.6 Conclusion	355
25 Virtual Queenscliff: A Computer Game Approach for Depicting Geography	359
25.1 Introduction	359
25.2 Background to the Emergence of a Game Approach	360
25.3 The Prototype – <i>Virtual Queenscliff</i>	361
25.3.1 Site Location	362
25.3.2 Choice of game engine	363
25.3.3 <i>CryEngine</i> Sandbox	364
25.3.4 Workflow	364
25.3.5 The Visualization Environment	366
25.4. Conclusion	367

26 Maps and LBS – Supporting wayfinding by cartographic means	369
26.1 Introduction	369
26.2 Analysis of route descriptions and sketches	370
26.3 Wayfinding test: How much detail is necessary to support wayfinding	371
26.4 General design goals of route descriptions	373
26.5 Presentation forms	374
26.5.1 Maps	374
26.5.2 Verbal Information	375
26.5.3 Images	376
26.5.4 Videos	376
26.5.5 3D Presentation Forms	376
26.5.6 Landmarks	377
26.6 Conclusion	379
27 Adaptation in mobile and ubiquitous cartography	383
27.1 Introduction	383
27.2 Challenges of mobile and ubiquitous cartography	383
27.2.1 A comparison of stationary, mobile, and ubiquitous map usage	383
27.2.2 Application scenarios of mobile map usage	384
27.2.3 General requirements for mobile maps	385
27.3 Mobile Internet and mobile map services	386
27.3.1 Web services	386
27.3.2 OGC Web services: Web Map Server and Web Feature Server	386
27.3.3 Functionality of mobile map services	386
27.4 Mobile geographic information usage context	388
27.4.1 Dimensions of mobile map usage context	388
27.4.2 Relationships between context dimensions	389
27.4.3 Influence of context factors on mobile map services	390
27.5 Adaptation of geographic information	391
27.5.1 Adaptation principle and adaptation process	391
27.5.2 Adaptable objects in mobile map services	392
27.5.3 Adaptation methodology and implementation concepts	393
27.6 Adaptation of geographic information in mobile map services	394
27.6.1 Adaptation methods in mobile map services	394
27.6.2 Configuration of map components	395
27.6.3 Emphasising highly relevant POI symbols	395
27.7 Conclusion and outlook	396

28 A Real-World implementation of Multimedia Cartography in LBS: <i>The Whereis</i> ® Mobile Application Suite	399
28.1 Introduction	399
28.2 Location	399
28.3 Webraska Mobile Technologies	400
28.4 <i>SmartZone Application</i> Concept	401
28.5 <i>SmartZone Applications</i> in Australia	403
28.6 <i>Sensis Wireless Platform (SWP)</i>	404
28.7 <i>SWP</i> for 3G	407
28.8 Conclusion	414
29 Standards, Norms and Open Source for Cartographic Multimedia Applications	415
29.1 Introduction	415
29.2 Intention and benefits of standards in multimedia map creation	416
29.2.1 Data, information and multimedia	416
29.2.2 Standardisation in authoring environment	418
29.2.3 The definition of an objective and its influence on using standards	420
29.3 Organisations and standardisation	422
29.4 Selection of standardised formats	423
29.5 Conclusion and vision	425
30 Scalable Vector Graphics and Web Map Publishing	427
30.1 Introduction	427
30.2 Open Standards	428
30.3 Using Scalable Vector Graphics to publish Web Maps	429
30.4 Case Study: Developing school SVG-Based school atlases	433
30.5 Interface Design – Template 4	434
30.6 Template four – code and interaction	435
30.7 Final Product	438
30.8 Conclusion	440
31 Cartographic Approaches to Web Mapping Services	441
31.1 Introduction	441
31.2 Web Map Services	445
31.3 Web Map Design	447
31.4 Thematic Information	449
31.5 Cartographic Network	451
31.6 Conclusions	452

32 From Mapping Physical and Human Geographies to Mapping 'Personal Geographies': Privacy and Security Issues	455
32.1 Introduction	455
32.2 The Internet and information access	456
32.3 Mapping Personal Geographies	456
32.4 Privacy	457
32.5 Going on-line with the Internet	458
32.6 Going wireless	459
32.7 Wireless and location	460
32.8 Business interest in LBS	461
32.9 Privacy concerns	462
32.10 Security and privacy initiatives	463
32.11 Problems with developing technology	465
32.12 Privacy issues	467
32.13 Conclusion	468
33 Location and Access: Issues Enabling Accessibility of Information	471
33.1 Introduction	471
33.2 Accessibility	472
33.3 The basics of accessibility	473
33.4 Alternative content creation	477
33.5 Location specific information	478
33.6 Location identification	478
33.7 Location based accessibility	479
33.8 Location/time based accessibility	480
33.9 Language accessibility	480
33.10 Common language descriptions	481
33.11 User profiles	482
33.12 Content descriptions	483
33.13 Intelligent servers	484
33.14 Conclusion and overall emerging possibilities	484
34 Use and Users of Multimedia Cartography	487
34.1 Introduction	487
34.2 Setting the scene	489
34.2.1 Use and users	489
34.2.2 A shift in focus	489
34.3 The nature of use and user research	490
34.3.1 Understanding and designing for the user	491
34.3.2 Iterative design and evaluation	492
34.3.3 Research techniques	493

34.4 Case study: a user-centred design approach for mobile tourism applications	496
34.4.1 Mobile usage environments	497
34.4.2 Investigation techniques	498
34.5 Conclusion	501
35 Future Directions for Multimedia Cartography	505
35.1 Introduction	505
35.2 Multimedia and Cartography: New Opportunities	506
35.3 The Nature and Quality of the Content of Multimedia Data	508
35.4 The Centrality of the User	510
35.5 Education, Entertainment and Edutainment	512
35.6 Commercial Aspects of Multimedia Cartography in the Experience Economy	513
35.7 Full Involvement of the Senses	515
35.8 Preserving Multimedia Cartography	517
35.9 Conclusion	519
36 Postscript to Multimedia Cartography Edition 2	523
36.1 Introduction	523
36.2 The Book	524
36.3 Acceptance of new technologies	529
36.4 Conclusion	530

1 Multimedia Cartography

William Cartwright and Michael P. Peterson

School of Mathematical and Geospatial Sciences, RMIT University,
Melbourne, Australia
Department of Geography, University of Nebraska at Omaha, Omaha,
USA

1.1 Introduction

The term '*multimedia*' was once used to refer to a sequential display of slides with a recorded voice-over. The concepts of *interactive multimedia* and *hypermedia* were introduced to refer to media combined with an interactive linking structure. The meaning of *multimedia* has evolved and now subsumes these newer concepts. Multimedia uses different media to convey information as text, audio, graphics, animation, and video, all done interactively. This provides 'rich media' content. It also refers to computer data storage devices, especially those used to store multimedia content. Multimedia enhances user experience and makes it easier and faster to grasp information. Multimedia *is* interaction with multiple forms of media supported by the computer. The computer is both the tool of multimedia and its medium. Without means of creation or distribution, the current interactive form of multimedia would not exist. The World Wide Web, both static and mobile, has dramatically increased the audience and use of interactive multimedia products.

Multimedia Cartography evolved from a need to present geographical information in an intuitive manner. Multimedia Cartography is best defined through the metaphor of the world atlas that revered assemblage of maps in book form that has introduced people to the world for centuries. Displayed prominently in people's homes, or stored for reference in the library or school, the atlas has been a window to the world for millions of people. It is consulted when one needs to know where something is located or something about a region of the world. The atlas forms the basis for how people conceive the world in which they live.

The atlas also has a general audience. Its use does not require any particular expertise or motivation. It is not intended for the expert user or

people from any particular educational background or for only a few, highly-trained individuals. Rather, it is an inclusive form of cartography that invites the user to explore the world through maps.

The traditional, printed atlas is not without its limitations. The maps lack interaction. It is not possible to change the scale of the maps or add detail. There is no provision to consult an underlying set of data. It is not possible to link features to other types of media, such as sound, pictures, or video. It is not possible to view cartographic animations that would depict the dynamic character of the world.

Interactive media is now commonplace and ubiquitous. Through the influence of the World Wide Web, users now expect a linking structure to be incorporated on any computer display. A display that is static is uninteresting and so it is with maps as well. The surface depiction is no longer sufficient. People want to “go into” the map, both spatially and conceptually. They want to explore at a deeper level. They want to put the pieces of information together themselves. These tendencies are not idle pursuits but can be attributed to the way we learn and structure knowledge. Interaction is the key to knowledge formation.

1.2 Visualizing geography

The general public use maps daily as a general information source, or as a tool to find specific locations when using a street directory or an atlas. They are bombarded with spatial information on television news reports, in newspapers and magazines and as part of computer packages for gaming, education and training. Technological developments have led to a wider range of different cartographic products that can be made faster and less expensively, and the interaction with visual displays in almost real-time. This has moved the emphasis from static to dynamic map use (Taylor, 1994), from discrete to distributed information provision, and from ‘wired’ access to ‘wireless’ access.

The ‘real’ geographical picture can be seen to be one that consists of many attributes. An efficient system for exploration would allow users to gain access to the ‘picture’ via a general, surface access mode or through a rigorous process of deep interrogation (Norman, 1993). At the ‘viewing end’ of the electronic mapping process users would be offered depiction methods which either painted a general information overview or else gave a very specific and precise graphic profile of essential user-defined geographical characteristics.

1.3 Access to geographical information

The spatial science professional is no longer the only one who should gain access to and present geographical information. Cartography has developed in two directions: the refinement of the means to represent natural points of reference; and the depiction of multiple phenomena. Therefore there exists the need to include more human-oriented elements in new media presentations and resources. There have been many comments about the needed evolution of current-day tools like GIS into one that will offer the required components for the next generation of user interaction, and it is suggested that this product should move from the 'technical elite' to the 'everyday user'. Commenting on GIS technology, Roe and Maidlow (1992) have noted that to date the vast majority of the emphasis has been placed on technical issues and that if it (GIS technology) is going to create value for the masses it is going to have to become more intuitive to use.

Many proposals have been made to rectify the shortfalls of digital mapping and GIS. Future systems were envisioned that incorporated image analysis and processing technology (Gallant, 1987); ones that included the cultural argument and information that highlighted human and social aspects, so as to reflect the basic goals of society (Chrisman, 1987); and new forms of data portrayal for the purpose of understanding, controlling and monitoring the multiple layers of space that make up the focus of human relationships (Müller, 1989). Other types of spatial data that were largely disregarded until fairly recently by the existing technology - photographs, free text, video images and sound, were seen in the future to play a greater role in decision-making than did all of traditional GIS (Lewis, 1991).

This technology-elaborated map could actually be many maps and provide access to information in ways dictated by the user. This would have the benefit of providing a map that is not just a picture of geographical reality, but also a search engine which, as well as giving access to geographical data and a means of data selection and display, also allows users to access further data and information plus a background on how things, data systems, data suppliers and facilitators, and mapping systems, and so on actually work. The geographically linked 'things' are a conglomerate of items, systems, processes and conventions.

1.4 A *Different* map

What multimedia offers is the ability to create a different map. By different map, what is meant is not merely something that is an 'electronic page turner', but a product which really extends the technology and allows for a

different way of presenting geographic information to change geographical information access. A multimedia-based mapping product is seen as a real alternative to conventional mapping (including those maps now being produced electronically). Most electronically-produced are still not really that different to the maps produced when the printing press harnessed cartographers to think in terms of page sizes, print-derived specifications and products which had to be technically correct the very first time they came off the press. For example, topographic maps design, and the efficient uses to which these maps can be put, owes much to eighteenth century generals and nineteenth century engineers (Raper, 1996). They served their purpose as a tool for the accurate depiction of hills, roads, streams and other strategic terrain elements for military strategy, but the advent of the aircraft made the importance of high ground less prominent. Similarly, engineers required accurate, large-scale representations of landforms to enable the planning and conduction of their Victorian age buildings. The role that these types of maps were used for, and the depiction methods used, served particular functions. The 'print mindset' has been extended into some areas of automated mapping, GIS maps, applied computer graphics-generated maps (like those in contemporary printed products and those used as support devices for television news and weather services) and even to digital data stored on CD-ROM. Peterson (1995, p. 12) speaks of a 'paper-thinking' that still pervades how we think about maps and the process of producing them. The print mindset has 'harnessed' map designers to the idea that computer-generated maps should mimic printed maps (Cartwright, 1994).

Multimedia is intended to expand the channels of information available to the user. Users should then be able to thread their way through a database query in ways not anticipated by the system designers. Multimedia is an accessible tool, both practically and economically, even though it has been 'hijacked' by the 'glossy' nature of many multimedia products. But, if multimedia is viewed as multi-media, then its potential in the application of access and display interfaces to geographical information in a variety of ways can be seen. Multimedia offers a different way to view data that has been generated and stored by the many existing spatial resources packages.

In the real world some things can appear to be something that they are not. How things appear on the surface of an interactive multimedia product is not representative of what is happening with the human part of the interaction. Designers of multimedia geographical information products are undertaking work to ensure that the media allows for individual mental maps or virtual worlds to be composed and thus making available artifacts that allow geographical information and the real world to be better understood. Users must be encouraged to include their own experience in the 'reading'

of the presented data. Multimedia allows the virtual world to be unfolded, scene by scene, where each unfolding offers a further unfolding.

1.5 Multimedia as an information interface

The traditional map form can be seen as a form of multimedia, whereby lines, colours, text, rendering, symbols, diagrams and carefully chosen content, were used to impart a 'story' about reality. Everyone is a product of their past training, and the limitations of the printed graphic map are still embedded in our thoughts and habits (Morrison, 1994). Those involved in the art and science of map-making should be content that these devices, paper or digital, accurately portray the phenomena that has been selected. However, the traditional delivery mediums cannot be viewed as an isolated entity in the digital electronic age, an age where arrays of information resources can be output in many different ways. This will restrict the possibilities for offering a package of information-enhanced map products. The multimedia revolution should be exploited to augment the capabilities of existing methods of geographical information processing (Groom and Kemp, 1995) and extend the use of the map as an isolated display device by adding extra data and information depiction methods. Interactive maps, using hot-spots and buttons to give access to the underlying data and metadata would allow for the map display to link to other information offering an enhanced spatial information resource.

Contemporary mapping, although providing timely and accurate products, may be still using formats which disallow them to be fully utilised. If one was to make a very general observation, the conclusion could be made that the formats and types of presentations used for the depiction of spatial data do not fully exploit the plethora of other information delivery devices in common usage. Telephones, television, faxes, computers, email, Web browsers, radio, newspapers, magazines, films and interactive mediums are all used to keep us informed in our own everyday lives. Maps can also adapt these other devices to enhance the communication of spatial information.

Tools like word processors and drawing programs are now commonplace. Users work with many tools on one computer and, increasingly, computer-based tools are used for communication with other people. Interactive systems are becoming gateways to communities and endless information spaces (Rijken, 1996). Hybrid tools, like the use of television for shopping and the use of metaphors to navigate through fairly complex data sets, have been developed. The choice of an 'ideal' tool is becoming com-

plicated as we move from the simple one-user, one-device to computer-supported collaborative work and the design of interfaces for entire organisations (Rijken, 1996).

Maps themselves have been designed for purposes that are far more intimate than the plethora of uses to which contemporary maps are put. If the types of graphic representations provided with contemporary spatial information products are looked at critically it could be said that the depiction methods used are still not that dissimilar to those that have developed from the specifications provided by military and engineering authors. Multimedia offers the tools for depicting spatial information through the use of many media tools. To limit depictions afforded by multimedia to just maps and plans does not exploit the rich forms of media that are available. Multimedia allows many other ways of presenting data sets and the results of analysis.

Multimedia is a new form of visual and aural presentation and expression. As a new communication form it has taken on its own grammar and made its own rules. The grammar is developing and (script)writers are only beginning to master it. The rules are new and already being broken, as new forms of multimedia are explored and other means of exploiting this conveyor of 'rich media' are tried, tested and developed. Multimedia has much to offer users of GIS in improving access to data and facilitating displays of that data in formats most compatible with an individual user's preferences for aiding their journey through a virtual world.

1.6 Visualizing Multimedia Cartography

Multimedia Cartography can be viewed as sphere that may moved by the user across and into a plane of geographical reality (see Figure 1). The Plane of Geographical Reality is composed of levels of abstraction. The user controls the sphere and can move down these levels. Moving the sphere across the surface affects a variety of other interrelated aspects of the display, such as scale and perspective. Critical in the use of multimedia
