Acknowledgements

In a collaborative book project like this, there are always many more people involved more or less directly than those who appear in the list of contributors. The original idea for the volume came from Lisa Börjesson. All the rest of us would like to thank her for bringing this group together.

In addition, the individual authors have colleagues to thank. Research conducted for the chapter of Bertrum MacDonald and Suzuette S. Soomai and related studies were supported by a grant from the Social Sciences and Humanities Research Council of Canada (#435-2015-1705) to Bertrum MacDonald. The both authors acknowledge the helpful review of the chapter provided by an external reader.

Joachim Schöpfel would like to thank Hélène Prost, Taryn L. Rucinski and Dobrica Savic for helpful information and advice. Gunilla Widén would like to take the opportunity to thank the DiWIL research group at Åbo Akademi University and Academy of Finland for the research grant supporting the project “The Impact of Information Literacy in the workplace” [no. 295743].

Lisa Börjesson would like to thank professor emeritus Michael Buckland and the Information Access seminar at the UC Berkeley School of Information for providing valuable support in the

initial phase of the project. She would also like to express her gratitude towards professor John Willinsky at the Stanford Graduate School of Education for initiated feedback on an early draft of the book proposal.

Isto Huvila would like to thank the members of the Archaeological Information in the Digital Society research project and COST Action Archaeological Practices and Knowledge Work in the Digital Environment for in-depth discussions and insights in knowledge making in archaeology and beyond. These acknowledgements can be extended to the members of NGIN and DiWIL research groups at Åbo Akademi University and my colleagues at the Department of ALM at Uppsala University for lengthy discussions on the changing information work practices in the contemporary society.

Moreover, we all are thankful for the support we have received from Josh Pitt, our Palgrave editor, and the editorial assistant Sophie Li. And, above all, we have been blessed to work with a group of curious and dedicated researchers. Thank you for sharing your insights with us and our readers!

Notes on Contributors

Lisa Börjesson has received her master's degree in Library and Information Science and her Ph.D. in information studies at the Department of ALM (Archival Studies, Library and Information Science and Museums and Cultural Heritage Studies) at Uppsala University in Uppsala, Sweden. She currently works as a coordinator for medical research documentation at Uppsala University in Uppsala, Sweden. Her research inquires into the development and application of policies for research documentation.

Patricia Faasse is a senior researcher at the Rathenau Instituut. She has been trained in science and technology studies, and specialized in historical science studies. After she received her Ph.D. in 1994 at the department of Science Dynamics at the University of Amsterdam, she worked for nearly 20 years as a freelance researcher and conducted research on the history of the Dutch research system and science policy. Her recent research focuses on the social dynamics of universities, public knowledge organisations and evidence for policy.

Bram Harkema graduated in the History and Philosophy of Science. He co-authored this chapter as a research intern, whilst studying the policy frameworks of Dutch public knowledge organisations.

Isto Huvila is a professor in information studies at the Department of ALM (Archival Studies, Library and Information Science and Museums and Cultural Heritage Studies) at Uppsala University in Sweden and is adjunct professor (docent) in information management at Information Studies, Åbo Akademi University in Turku, Finland. His primary areas of research include information and knowledge management, information work, knowledge organisation, documentation, and social and participatory information practices.

Lionne Koens is a researcher working at the Rathenau Instituut. After bachelors in the liberal arts (primarily history and political science) and philosophy, she received her MSc degree in public administration. Her research at the Rathenau Institute is primarily focused on mission-oriented, public knowledge organisations in the Netherlands.

Elina Late works as a postdoc researcher and a lecturer at University of Tampere in the Faculty of Communication Sciences. She defended her dissertation titled “Cultural and contextual shaping of scholarly communication. Publishing and reading practices in Finnish state research institutes” at the University of Tampere in 2014. Her research interests include scholarly communication and open science.

Bertrum H. MacDonald is a professor of Information Management in the School of Information Management, Dalhousie University, Halifax, Nova Scotia, Canada, where he also heads the interdisciplinary Environmental Information: Use and Influence research program (www.eiui.ca). He holds degrees in science (BSc—Biology), history of science (MA), and information science (MLS and Ph.D.). He has served as the Director of the School of Information Management and Associate Dean (Research) and Dean of Management at Dalhousie University. His research interests focus on the communication of scientific information (historically and current day) and on the roles of information at the science-policy interface in marine environmental contexts.

Diane Mizrachi is a Social Science and Undergraduate Instruction Librarian at the Charles E. Young Research Library, University of California Los Angeles (UCLA). Her own research focuses on undergraduates' library and information behaviours, including library anxiety, information literacy needs, personal academic information management, and students' preferences for reading their academic texts in print and online formats. Mizrachi is also on the language editorial team for the European Conference on Information Literacy (ECIL). In 2015–2016 she served as the President of the Librarians Association of the University of California (LAUC).

Joachim Schöpfel is a senior lecturer in library and information sciences at the University of Lille, member of the GERiiCO research laboratory and independent consultant in scientific information. He was manager of the INIST (CNRS) scientific library from 1999 to 2008, head of the Lille Department of Information and documentation sciences from 2009 to 2012 and director of the French digitization centre for Ph.D. theses (ANRT) from 2012 to 2017. His research interests are scientific information and communication, especially open access and grey literature, research data, copyright, library management and job development. He holds a Ph.D. in Psychology from the University of Hamburg.

Suzette S. Soomai is a postdoctoral Fellow with the Environmental Information: Use and Influence (EIUI) research program at Dalhousie University, Halifax, Canada. She holds an Interdisciplinary Ph.D. and a Master in Marine Management from Dalhousie University, and a Master of Philosophy in Zoology and a BSc from the University of the West Indies. Her interdisciplinary research focuses on the roles of scientific information produced by national, regional, and international organizations in policy and decision-making for marine fisheries management. She has over 10 years of professional experience in fisheries resource assessment and management as a government fisheries scientist in Trinidad and Tobago. She has worked closely with the fishing industry in the Caribbean as well as regional and international fisheries management organizations in a range of research activities including fish

stock assessments, aquaculture, and at-sea testing of bycatch reduction gear technologies.

Gunilla Widén is a professor of Information Studies at Åbo Akademi University, Docent in Information Management at University of Tampere, and member of the Finnish Society of Sciences and Letters. Her research interests are within the areas knowledge management and information behaviour, using e.g. social capital and information culture theories. She has led several large research projects financed by Academy of Finland, currently a project about the impact of information literacy in the digital workplace (2016–20). She has published widely in her areas of expertise and been appointed expert in several evaluation committees.

Introduction

Lisa Börjesson and Isto Huvila

Archaeologist: I have applied for research funding from this foundation... This time I'll let the funding go into the company. It's very disadvantageous for me to live off stipends. Then you live off as little as possible, don't save for your pension, have no security if you get sick. That's useless!... One could say that I have one foot in academic research and the other in contract archaeology, even if my full-time employment is in contract archaeology... It's quite a schizophrenic situation, actually...

Interviewer: But why, what's motivating you?

Archaeologist: It's an interest, for what we do. I think these [academic research] projects are very engaging... And even if we have the obligation to be in the forefront of research, pose the smartest and newest research questions in the investigation plans [in contract archaeology], we don't always get the possibility to do that. It [contract archaeology]

is so streamlined today. For me, it [research] is some kind of breathing space... (Archaeologist in interview, September 22, 2015)

Where and when knowledge is made are core questions in studies of science and philosophy of knowledge. If we approach these questions from a more practical angle, they do slightly change shape to an interest in where researchers work and when research does take place.

Research takes place in a variety of organizations throughout the society from government research institutes, research and development (R&D) departments at private institutions, to independent research organizations (Nowotny et al. 2001). Research is also conducted by individuals and groups of individuals acting as independent researchers (Finnegan 2005). Citizen group-based research is sometimes branded citizen research or street science (Corburn 2005).

The distribution of research throughout society is sometimes linked to the emergence of what has been called the “information” (May 2002; Webster 2006) or “knowledge” (Böhme 1997) society. However, research taking place in a variety of different organizations is by no means a new phenomenon. Schiffer (2014) goes as far as to suggest that research, if defined broadly enough, has happened in all societies throughout the ages and involved people far beyond individuals who have committed their life to science and scholarship. Over time, many individuals and groups, for example, teachers and priests, have engaged in scholarship, and many experiments and inventions have sprung from industry and military. Moreover, government collection and analysis of data for practical purposes from census keeping and analysis (Brückweh 2015) to the past development of trigonometric tables for nautical purposes (Huebner et al. 2018) can be likened to research. What is special about the contemporary situation depends on a compound of reasons. Firstly, the degree to which students pursue higher degrees and enter into working life with research skills and ambitions supersede any earlier period (Kehm 2006). Secondly, research and knowledge making have special political and cultural connotations in the branding of states and organizations, and as means for improving their competitiveness (Miele 2014). In parallel, the notions of research, knowledge making and innovation have been detached from research

organizations to become potential assets and activities of all kinds of organizations (Amin and Cohendet 2004), and trade of ‘research’ itself has faced a wave of commodification through the establishment of markets for research and consultation services (Nordenflycht 2010).

The topic of this edited collection is the research taking place outside universities, with the aim to investigate the information-related premises for conducting research in these settings. Lately, both the scholarly and the popular interest in knowledge production outside academia has focused on amateur researchers, and on the catalysing effects of digital technologies, e.g. to elicit or crowdsource ‘professional quality’ knowledge from non-professionals. In contrast, and in spite of tendencies to emphasize the importance of evidence-based practices and applied research in society (e.g. in health care and education), there has been much less debate about, and scholarly interest in, knowledge production taking place outside academia, in extramural organizations. Today, a significant number of professional practitioners across disciplines have ambitions, and directives to use research methods, to make knowledge, and to contribute to knowledge development from organizations outside academia. In this book, we ask: what are their premises to do so?

All That Glitters Is Gold?

The introductory questions are but half-answered. Research potentially takes place in a broad range of organizations throughout society. But is all that glitters gold? Can everything called research qualify as research? Is all research the work of research educated persons? Or only when they work to answer a certain type of questions in specific ways? There are a variety of ways of defining research, and a range of standards by which to evaluate research.

The definitions of research and scientific work range from broad inclusive ideas that all societies have been engaged in science to narrow perspectives of research as a clearly framed paradigmatic exercise (Schiffer 2014). It is relatively typical to define research either as a process or through its outputs (Brew 2001). Defining what research is, however, not the same as trying to demarcate it from non-research.

There is a plethora of ways of drawing lines between research and non-research and between different types of research on the basis of who funds the work and (e.g. public institutions, individuals funding their own research, commercial companies), where the work is being conducted (e.g. laboratory, field, at home, workshop), how the work is conducted and evaluated (e.g. is work peer-reviewed), if the work is accepted by other researchers (e.g. is it read and cited), and how individuals and groups themselves describe their work as research or as something else (e.g. as innovations, evaluations, consultancy deliverables). There is not much controversy to say that a research fellow at a university is probably conducting research and pre-school-aged children are, even if their exploration of the world would be driven by a similarly strong determination to know more, probably not engaged in research proper. But what about student work at universities, industrial development work outside of formal research organizations and laboratories, or 'research' done by journalists and consultants? Sometimes, the answer is undoubtedly positive, but it is doubtfully always a yes.

One of the most cited categorizations of academic and extra-academic research of the past few decades (Hessels and van Lente 2008) are the modes 1 and 2 coined by Gibbons and colleagues (1994) in a study funded by the Swedish Council for Research and Planning in the early 1990s. Mode 1 refers to research launched and conducted within universities and other research institutions. Gibbons et al. (1994) use Mode 2 to denote a novel approach to knowledge making distributed in the society and addressing societal knowledge needs. The idea is that Mode 2 type of knowledge making has emerged as a parallel to the more traditional, academic-oriented Mode 1 knowledge making. A later volume published by three of the authors of the work from 1994 (Nowotny et al. 2001) elaborated and theorized the discussion of the transformation of societal knowledge making, drawing on a broad range of authors from Giddens to Rorty and Latour.

In this edited collection, we use a pragmatic notion of extra-academic research to refer to situations in non-university organizations where people either are ordered to do research, or call their work tasks research. Many of these organizations can be described, following Gulbrandsen (2011), as *hybrid organizations* engaged in two or more

spheres, for instance, in commercial production in addition to research. The focus of the volume is on research in public organizations and organizations serving the public sector, but as many of the chapters show, the boundary between public and commercial research is all but clear-cut, and further, as Widén's text shows, the conditions of knowledge making in business organizations come close to and overlap the conditions of research in non-commercial organizations discussed in other chapters. Further, as, for instance, in the case of contract archaeology, knowledge production directed to the public is in some cases conducted by private actors and in others, by public organizations. The same applies to healthcare and many other public services. In this sense, it is difficult to provide a clear definition of what is denoted as public and the private sector even if it is apparent that in the current neo-liberalistic policy climate, a large number of countries have engaged in what Fleming (2014) has described as a massive confiscation of public property of the welfare state to a handful of private actors and a creation of a "false public sector".

By means of this pragmatic approach, we encircle research activities in government research institutes (Late) and public knowledge organizations (Koens, Harkema and Faasse), in environmental research organizations (MacDonald and Soomai), commissioned archaeology (Börjesson and Huvila) and libraries (Mizrachi). Furthermore, we include meta-perspectives on extra-academic research through chapters analysing knowledge and literature sharing practices (Schöpfel), bring contrast to the public knowledge making by providing a glimpse to business organizations (Widén), and the premises for knowledge production in these settings (Huvila). The research activities encircled by this pragmatic notion share the characteristic that they mainly take place outside university settings. The activities are financed by other means than through university-administered funding. The researchers work for other bodies than universities or university colleges.

By using the pragmatic notion of extra-academic research, we make academia and the outside thereof into ideal forms and set up an analytical demarcation between the two. When drawing such lines, it is important to emphasize that people in different disciplines, with different terms for employment, and in different situations, experience
