Lecture Notes in Mechanical Engineering

Lecture Notes in Mechanical Engineering (LNME) publishes the latest developments in Mechanical Engineering—quickly, informally and with high quality. Original research reported in proceedings and post-proceedings represents the core of LNME. Volumes published in LNME embrace all aspects, subfields and new challenges of mechanical engineering. Topics in the series include:

- Engineering Design
- Machinery and Machine Elements
- Mechanical Structures and Stress Analysis
- Automotive Engineering
- Engine Technology
- Aerospace Technology and Astronautics
- Nanotechnology and Microengineering
- Control, Robotics, Mechatronics
- MEMS
- Theoretical and Applied Mechanics
- Dynamical Systems, Control
- Fluid Mechanics
- Engineering Thermodynamics, Heat and Mass Transfer
- Manufacturing
- Precision Engineering, Instrumentation, Measurement
- Materials Engineering
- Tribology and Surface Technology

To submit a proposal or request further information, please contact the Springer Editor in your country:

China: Li Shen at li.shen@springer.com

India: Dr. Akash Chakraborty at akash.chakraborty@springernature.com

Rest of Asia, Australia, New Zealand: Swati Meherishi at swati.meherishi@springer.com

All other countries: Dr. Leontina Di Cecco at Leontina.dicecco@springer.com

To submit a proposal for a monograph, please check our Springer Tracts in Mechanical Engineering at <http://www.springer.com/series/11693> or contact Leontina.dicecco@springer.com

Indexed by SCOPUS. The books of the series are submitted for indexing to Web of Science.

Preface

International Conference on Industrial Engineering took place on March 25–29, 2019, in Sochi, Russian Federation. The conference was organized by four universities—South Ural State University (National Research University), Moscow Polytechnic University, Platov South-Russian State Polytechnic University, and Volgograd State Technical University.

The conference was carried out under financial support of the South Ural State University (National Research University).

The conference was really large-scaled and international. The international program committee has selected more than 500 reports. The conferees represented 63 Russian cities from the western and central parts to the Far East regions. International participants represented such countries as China, Germany, Kazakhstan, Kyrgyzstan, Portugal, Saudi Arabia, Tajikistan, Ukraine, USA, Uzbekistan.

The conference participants submitted papers reflecting recent advances in the field of Industrial Engineering, in Russian and English. The conference was organized into 13 sections, including Part 1 “Mechanical Engineering” (Machinery and Mechanism Design; Dynamics of Machines and Working Processes; Friction, Wear, and Lubrication in Machines; Design and Manufacturing Engineering of Industrial Facilities; Transport and Technological Machines; Mechanical Treatment of Materials; Industrial Hydraulic Systems; Green Manufacturing) and Part 2 “Materials Engineering and Technologies for Production and Processing” (Polymers, Composites and Ceramics; Steels and Alloys, Metallurgical and Metalworking Technologies; Chemical and Hydrometallurgical Technologies; Surface Engineering and Coatings; Processing and Controlling Technologies).

The international program committee selected 294 papers from Part 1 of the conference technical sections for publication in book series “Lecture Notes in Mechanical Engineering.”

The organizing committee would like to express our sincere appreciation to everybody who has contributed to the conference. Heartfelt thanks are due to authors, reviewers, participants and to all the team of organizers for their support and enthusiasm which granted success to the conference.

Chelyabinsk, Russia

Contents

Part 1

Modeling of Roll Roughness Transfer Process to Strip During Skin-Pass Rolling	1
N. N. Ogarkov, S. I. Platov and E. U. Zvyagina	
Working Surface Calculation of Teeth Bevel Gear Helical-Bevel Gearing at Milling with Hob	9
E. A. Poluektov, B. A. Lopatin and S. V. Plotnikova	
Effectiveness of Application of Additional Strengthening Processing of Surface Plastic Deformation on Increase in Fatigue Life of Parts	17
V. A. Lebedev, A. V. Kirichek and L. V. Chunakhova	
Determination of Rational Technological Parameters of Cold Bending with Rolling of Pipes from Corrosion-Resistant Steels	27
E. V. Khaliulin, A. V. Bobylev and A. V. Kozlov	
Recomposition Procedure of Automatic Replacement Laser Modules for CNC Machines	41
P. A. Ogin and D. G. Levashkin	
Tooling Backup of Cutting and Deforming Processing of Non-rigid Shafts	51
E. I. Yatsun, N. P. Anikeyeva and I. S. Karnaukhov	
Determination of Flanging Parameters and Length of Screwing in Producing Holes by the Method of Thermal Drilling in Thin-Sheet Metal	59
P. V. Shalamov, I. A. Kulygina and A. N. Yasnitsky	
Practice of Dimensional Modeling in the Implementation of the Methodology of Group Interchangeability	69
M. G. Galkin and A. S. Smagin	

Determination of Settling Efficiency of Solid Finely Dispersed Particles Within Devices with Rectangular Separators	79
I. N. Madyshv, O. S. Dmitrieva and A. V. Dmitriev	
Method for Predicting Thermal Characteristics of Machine Tools Based on Experimental Modal Analysis	85
A. N. Polyakov, A. N. Goncharov and I. V. Parfenov	
Development of New Types of Contact Devices for Heat-Mass Transfer Apparatuses, Used at Petrochemical Enterprises	95
I. N. Madyshv, O. S. Dmitrieva and A. V. Dmitriev	
Stiffness Maximization on the Basis of Layout Characteristics of the Elastic Machine System and Milling Process	103
R. M. Khusainov and A. R. Sabirov	
Formation Automation of Geometric Configuration of Real Machine Parts	111
V. E. Lelyukhin, O. V. Kolesnikova and O. M. Ponkratova	
Information Model for Machine's Electronic Structure Storage	121
A. Loginov	
Software Spindle Speed Variation as Method for Chatter Suppression in Drilling	131
V. M. Svinin, A. V. Savilov and A. V. Shutenkov	
Experimental Studies of Steady-State Sources of Vibrations of Machinery Production Process Equipment to Substantiate Choice of Vibration Protection Methods	141
S. I. Gvozdikova and L. E. Shvartsburg	
On Issue of Verifying New Method for Studying Dynamics of Deep Hole Machining	151
L. Mironova, L. Kondratenko and V. Terekhov	
Rational Provision of Robustness Properties of Bolted Joints of Assembly with Implementation of Anaerobic Materials	163
I. I. Voyachek, D. V. Kochetkov and S. G. Mityasov	
Machining Accuracy Improving with the Use of Mobile Mechatronic Systems as Industrial Robot End Effectors	171
E. I. Shchurova and P. G. Mazein	
Voxel and Finite Element Modeling of Twist Drill	181
E. I. Shchurova	
3D Modeling of Turbine Rotor Journal Machining with Location on a Bearing Bottom Half	191
A. V. Shchurova	

Geometric Modeling of Macro-defects of Parts Surfaces Based on Discrete Solid-State Modeling	199
I. A. Shchurov	
Selecting Criterion of Long-Term Strength in Assessing Durability of Constructions Operating Under Non-isothermal Loading Processes	209
A. V. Belov, A. A. Polivanov and N. G. Neumoina	
Virtual Prediction of Accuracy of Processing on Example of External Circular Grinding	217
P. P. Pereverzev, A. V. Akintseva and M. K. Alsigar	
Designing of Optimal Grinding Cycles, Sustainable to Unstable Mechanical Processing on the Basis of Synthesis of Digital Double Technology, and Dynamic Programming Method	225
P. P. Pereverzev, A. V. Akintseva and M. K. Alsigar	
Controlled Assembly of Rotors	233
S. M. Beloborodov, V. F. Makarov and M. L. Tselmer	
Study of Energy Intensity of Shaped Holes Broaching Process	241
V. V. Kuts, M. S. Razumov and V. S. Kochergin	
Methods of Quality Control Manufacturing Gears of the Differential Satellites	249
D. T. Safarov and A. G. Kondrashov	
Computational and Experimental Studies of Deformations of Air-Cooled Diesel Cylinders at Its Assembling	261
I. E. Agureev, K. Yu. Platonov and R. N. Khmelev	
Feasibility Study of Applying Group Interchangeability Method for Assembly Components of Machines	271
I. I. Voyachek, E. S. Slashchev and D. M. Malikova	
Development of Integrated Criterion to Select Environmentally Sound Cutting Fluids and Relevant Application Systems in Shape-Forming Processes	281
L. E. Shvartsburg, O. V. Yagolnitser and E. V. Butrimova	
Gear-Grinding Temperature Modeling and Simulation	289
N. V. Lishchenko and V. P. Larshin	
How Parameters of Agricultural Machine and Tractor Unit Affects Effectively Used Mean Indicated Power	299
M. Ya. Durmanov, B. G. Martynov and S. V. Spiridonov	

Method to Reduce Oil Burning in Diesel Engine of Agricultural Machine and Tractor Unit	313
V. P. Antipin, M. Ya. Durmanov and O. A. Mikhailov	
Mill Conditions Effect on Roughness of Injection Molds' Forming Surfaces	325
S. I. Kozhevnikov and V. F. Makarov	
Effect of Magnetic Processing on Mass Transfer in a Frictional Pair "Alloyed Steel–Carbon Steel"	337
A. N. Gots, V. V. Zelinskiy and E. A. Borisova	
Strength Parameters of Hardening Cylindrical Workpieces by Tapered Roller	347
A. A. Udalov, A. V. Udalov and S. L. Vasilevykh	
Formation of Schemes Generating Geometric Structure of Machine Parts	355
O. V. Kolesnikova, V. E. Lelyukhin and F. Yu. Ignatev	
Optimization of Cutting Parameters in Milling by Means of System Nyquist Plot	365
R. M. Khusainov, P. N. Krestyaninov and D. D. Safin	
Comprehensive Evaluation of Shaft Manufacturability: Mathematical and Information Models	373
A. Sychugov, Yu. Frantsuzova and V. Salnikov	
Simulation of Electrical Discharge Machining of Micro-holes	381
T. D. Nguyen, V. M. Volgin and V. V. Lyubimov	
Investigation of Kinematic–Geometric Characteristics of Electrochemical Machining	391
V. V. Lyubimov, V. M. Volgin and V. P. Krasilnikov	
Model for Numerical Simulation of Temperature Field and Bead Profile in Hybrid Laser-Arc Welding of T-Joint	399
S. Ivanov, E. Valdaytseva and I. Udin	
QMS as Tool for Improving Maintenance and Repair Processes of Traction Rolling Stock	411
A. V. Muratov, V. V. Lyashenko and S. A. Petukhov	
Heat Treatment Effect on the Structural and Elastic Characteristics of a Single-Component Abrasive Tool	419
M. Yu. Polyanchikova	
Approach for Modeling and Situational Management of Industrial Product Efficiency	427
E. V. Orlova	

Modeling of Try-Out and Reliability Estimation of Technological Processes of Machine-Building Products	439
V. M. Trukhanov, M. P. Kukhtik and A. M. Makarov	
Methods of Cutting Cost Minimizing in Problem of Tool Route Optimization for CNC Laser Machines	447
A. F. Tavaeva, A. A. Petunin and E. G. Polishchuk	
Development of Hardware-Algorithmic System for ICE Diagnostics	457
L. A. Galiullin and R. A. Valiev	
Information Support of Gas-Turbine Engine Life Cycle Based on Agent-Oriented Technology	469
A. Zagitova, N. Kondratyeva and S. Valeev	
Automatic Print Job Scheduling and Management Over Multiple 3D Printers	477
I. A. Gushchin, I. V. Martynovich and I. S. Torubarov	
CNC Processing Equipment’s Technical Operability Evaluation by Developing Mathematical Models Based on Continuous Logic of Antonyms	489
E. Krylov, N. Kozlovtseva and A. Kapitanov	
Digital In-Line Moisture Meter of Thin Sheet Materials	501
S. V. Makartichyan, L. V. Khoperskova and V. E. Avvakumov	
Modeling Physical Operating Principles During Search Design of Cooling and Refrigerating Systems	511
A. A. Yakovlev, V. S. Sorokin and S. G. Postupaeva	
Analysis of Measurement System Accuracy Based on 2D Laser Triangulation Scanner When Measuring Soiled Pipe Thread Pitch and Height	521
D. S. Lavrinov	
Mechanics of Elastic Wheel Rolling on Rigid Drum	531
M. Yu. Karelina, T. A. Balabina and A. N. Mamaev	
Technical Audit of Rotary Aggregates	541
S. G. Mogilny, A. A. Sholomitskii and A. L. Sotnikov	
Hydroblow as Mechanism of Additional Intensification of Liquid Forages Preparation in Centrifugal-Rotor Dismembrators	551
Yu. N. Kamishov, N. A. Makarova and A. A. Sitnikov	
Change of Structure of Dispersion Material Under Dynamic Loads	559
E. K. Chabutkin	

Increasing Efficiency of Vibratory Rollers Through Adjusting Magnitude of Disturbing Force	567
Y. G. Popov and E. K. Chabutkin	
Energy Component of Properties of Material Crushability Layer	577

Modeling of Roll Roughness Transfer Process to Strip During Skin-Pass Rolling

N. N. Ogarkov, S. I. Platov and E. U. Zvyagina

Abstract In this paper, the modeling of a roll roughness transfer process to the strip in terms of skin-passing conditions was carried out. In the present paper, the analysis of the strain–stress state of material imprinted into microcavities of roll face is made, for which reason the latter is presented in the form of V-shaped grooves. The model of roll roughness transfer to the strip was developed by taking into account the real distribution of material in the rough layer of the roll and the strip, as well as according to the type of roll processing and skin-pass conditions that allows evaluating the degree of filling a singular microcavity under known pressure values of the strip on contact with a roll, friction coefficient, roll roughness parameters, and skin-pass conditions. The findings afford to forecast a reproduction of roll microrelief of the surface of deformed strip.

Keywords Microrelief · Microrelief transfer mechanism · Reproduction · Microcavity · Temper-rolled strip · Coefficient of imprinting

1 Introduction

One of the understudied key problems to be solved relates to relating the rolling conditions and roll roughness parameters and cold-rolled strip to the necessary required surface microgeometry of the finished product with account of the consumer performance [1–8].

The formation of the prescriptive strip microrelief directly near the roll pass is carried out by means of transfer mechanism of roll face microrelief to the strip and transformation of the initial microrelief [9–14].

2 Theoretical Research

We define the quantitative evaluation of imprinting process of roll roughness to the skin-passed strip by the coefficient of imprinting K which is represented by ratio of material flow value of the skin-rolled strip z_f to the size of roll microcavity characterized by a parameter R_z (Fig. 1).

The problem will be solved for triangular roll microcavity the stress condition in which while filling while skin-rolled steel is shown in Fig. 1.

Please do not alter the formatting and style layouts which have been set up in this template document. As indicated in the template, papers should be prepared in single column format suitable for direct printing onto paper. Do not number pages on the front, as page numbers will be added separately for the preprints and the proceedings. Leave a line clear between paragraphs. All the required style templates are provided in the file “MS Word Template” with the appropriate name supplied, e.g. choose “heading1” for your first-order heading text, “abstract” for the abstract text, etc.

The determination of dimensionless stress necessary for filling the material into V-shaped cavities will be fulfilled by using Bocharov formula [15], which relative to adjacent toward one other roughness cavities takes the following form:

$$\frac{P}{\sigma_s} = \frac{4}{\sqrt{3\pi}} \left[3 \ln \left(\frac{1}{1 - \frac{z_f}{R_z}} \right) + \frac{\pi S}{h} \right], \quad (1)$$

where P —rolls pressure during skin-pass rolling; σ_s —yield strength of skin-rolled steel; R_z and S —height and stepwise roll face roughness parameter [16, 17]; h —thickness of outlet skin-pass strip.

Fig. 1 Stress condition diagram by filling V-shaped roll microcavity with skin-rolled steel

Considering that $\frac{\sigma}{R_z} = K$ and solving an Eq. (1) in relation to K we shall obtain:

$$1 - \frac{1}{\exp \frac{1}{3} \left[\frac{\sqrt{3\pi} P_{cp}}{4\sigma_s} - \frac{\pi S}{h} \right]}. \quad (2)$$

To evaluate the rolls' pressure, we shall rely on the features of skin-pass rolling process and admit the following assumptions:

- working rolls of the skin-rolling mill are drive, of the same diameter with the same roll face roughness;
- form of roll contact with skin-rolled strip is flat;
- dry skin-pass rolling is carried out with the friction coefficient at the deformation area ... $\mu = 0,25 \dots 0,35$.

Due to higher friction coefficient values, the neutral point at the deformation area is located near the center of contact line.

With due account of the assumptions, the pressure at the deformation area without regard to roughness contacting will be determined by the following equation:

$$P = \sigma_d \left[\frac{h_0(1 - \varepsilon)}{\mu L} \right] \left\{ \exp \left[\frac{\mu L}{h_0(1 - \varepsilon)} \right] - 1 \right\}, \quad (3)$$

where ε —skin-roll strip draft; L —contact length a roll—a skin-roll strip; μ —coefficient of friction at the roll pass; h_0 —thickness of skin-roll strip in input.

Relating to the contact of roll deformed strip with large friction coefficient, it was shown in the papers [3, 18, 19] that a contact length a roll—a strip can be determined on the following formula:

$$L = \frac{1}{4} \left[D\varepsilon\mu + \sqrt{(D\varepsilon\mu)^2 + 8Dh_0\varepsilon} \right], \quad (4)$$

where D —work roll diameter.

The minimum pressure of skin-roll passing required for strip deformation shall be determined from the following formula [20]:

$$\sigma_d = 1.15(\sigma_s + d \lg 1000\dot{\varepsilon}) - \sigma_t, \quad (5)$$

where σ_s —yield stress determined by tension testing at a standard strain rate; d —dynamic coefficient considering the velocity effect when magnified ten times; $\dot{\varepsilon}$ —strain rate during skin-roll passing; σ_t —tensile stress at the roll pass determined by strip tension stresses between a uncoiler and mill stand and a mill stand and coiler.

The average strain rate $\dot{\varepsilon}$, at which a skin-roll passing is carried out, can be determined by approximation:

$$\dot{\varepsilon} = \frac{2V}{D\mu}, \quad (6)$$

where V —velocity of roll periphery.

The shortcoming of the Eq. (3) is that it includes the friction coefficient at roll pass, but it does not consider the fact that an imprinting of work roll surface roughness to skin-rolled strip is carried out within the limits of their rough layers and depends significantly on the fact to what extent the deformation processes of the skin-roll strip at roughness contact zone interact against each other and with the «base», on which they are located.

During skin-roll passing, the pressure that defines the bearing power of rough layers shall be determined by their bearing surfaces. The regularity of change in bearing surfaces when approaching of roughness is determined by their supporting curves. Considering that the degree of involvement of roll face micro-irregularities and the strip is different, it is reasonable to use their medium integral values [21] that determine the relative quantity of the steel in rough layers.

The approach of roll rough surfaces and skin-rolled strip will lead to the occurrence of total supporting surface of rough layers. We suppose that the total supporting surface is to be determined by a ratio:

$$q = \frac{q_1 + q_2}{2}, \quad (7)$$

where q_1 and q_2 —the percentage of material in rough layers of the roll and the strip.

The parameter points q_1 are presented in Table 1.

The parameter q_2 while strip rolling by sizing rolls shall be 0.43–0.59, depending on roll surfaces condition.

In consideration of the foregoing, the actual contact pressure of rough surfaces at the roll pass shall be

$$P_{sh} = P/q. \quad (8)$$

Table 1 Parameter points q_1 for different cold roll surface finishing

Processing type	$R_{\max}/\mu\text{m}$	q_1
Grinding	4.7/3.2	0.402/0.485
	2.4/1.6	0.423/0.519
	1.2/1.0	0.550/0.566
Wheel-blasting	8.6/5.8	0.482/0.538
	4.8/3.2	0.503/0.564
	1.2/0.8	0.548/0.576
Electroerosion texturizing	12.1/7.2	0.489/0.543
	9.6/4.9	0.533/0.564
	4.2/1.2	0.567/0.576

The dimensionless steel pressure of the skin-pass mill rolls with account of formulas (3), (4), (5), and (6, 7 and 8) shall be written as follows:

$$\frac{P_{sh}}{\sigma_s} = \frac{1}{q} \left[1.15 \left(1 + \frac{d \lg 1000 \frac{2V}{D\mu}}{\sigma_s} \right) - \frac{\sigma_t}{\sigma_s} \right] \left[\frac{h_0(1-\varepsilon)}{\mu L} \right] \left\{ \exp \left[\frac{\mu L}{h_0(1-\varepsilon)} \right] - 1 \right\}. \quad (9)$$

The formula used for calculation the coefficient of imprinting will be finally written as follows:

$$K = 1 - \frac{1}{\exp \left\{ \frac{\sqrt{\pi}}{6q} \left[\left(1 + \frac{d \lg 1000 \frac{2V}{D\mu}}{\sigma_s} \right) - \frac{\sigma_t}{\sigma_s} \right] \left[\frac{h_0(1-\varepsilon)}{\mu L} \right] \left\{ \exp \left[\frac{\mu L}{h_0(1-\varepsilon)} \right] - 1 \right\} - \frac{\pi S}{3h} \right\}}. \quad (10)$$

The application of the formula (10) allows to determinate the coefficient of imprinting of the roll roughness on the strip including the real distribution of material in a rough layer of the roll and the strip depending on the original roughness of roll face, the thickness of roll skin strip, rolling speed, tension stress, and drafting.

The target values of the coefficient of imprinting by variances of skin-pass rolling are given in Fig. 2.

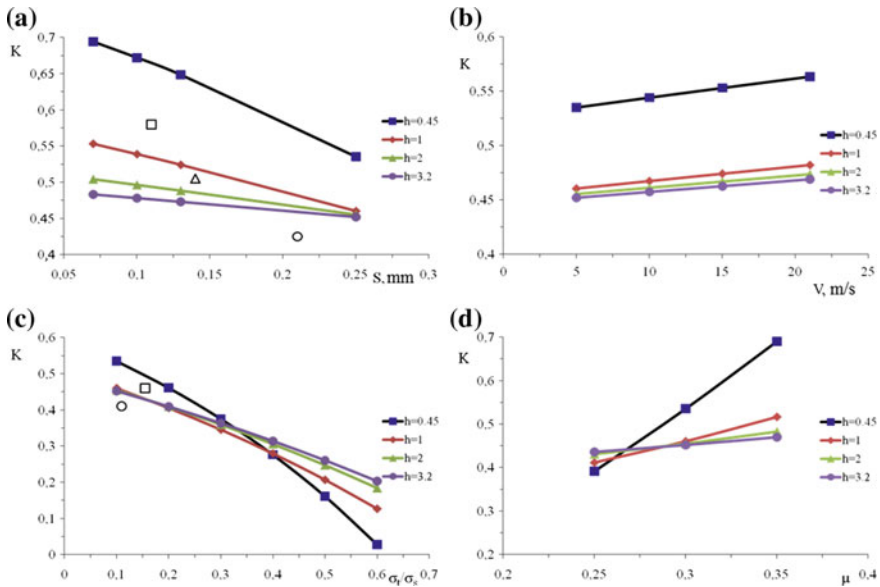

Fig. 2 Dependence of coefficient of imprinting K compared to experimental data— Δ \square \circ by skin-pass rolling of a strip of different thickness with original data $D = 500$ mm, $\varepsilon = 0.02$, $q = 0.5$, $d = 12$ on: **a** stage of microroughness; **b** velocity of roll periphery; **c** tension capacity; **d** coefficient of friction

The resulting dependence allows concluding that the best reproduction of the roll microrelief on the skin-rolled strip is evidenced during “dry” skin-pass rolling of thin strip with little microroughness width.

The resulting data are recommended for dry skin-pass rolling of the strips and for wet skin-pass rolling to a limited extent [22, 23].

The increase in strip tension dramatically reduces the imprinting of roll microrelief at the surface of skin-rolled strip.

By increasing in the roll velocity, there is a minor effect on change in coefficient of imprinting especially for thick strips.

3 Conclusions

The roll roughness transfer model to the strip was developed with account of the roll processing type and skin-pass rolling conditions that allow estimating the degree of filling of microrelief of singular microcavity at the known pressure values at the contact of the strip with the roll, friction coefficient, roll roughness parameters, and skin-pass rolling conditions.

The resulting data can be used in amendments of the existing and developments of new skin-pass rolling conditions for cold-rolled strips to obtain the required microrelief according to the consumer properties by taking into account the coefficient of microgeometry of roll face of the skin-pass rolling mill.

Working Surface Calculation of Teeth Bevel Gear Helical-Bevel Gearing at Milling with Hob

E. A. Poluektov, B. A. Lopatin and S. V. Plotnikova

Abstract The paper considers an internal gearing of a bevel gear and a spur gear, shaped according to a conventional technology. There is a technological problem of obtaining the working profile of the bevel gear teeth in the internal spur–bevel gearing when the working profiles are being shaped. Obtaining a theoretically accurate surface of the gear teeth is troublesome due to the difficulty of making cutters with internal teeth and practical realization of machine gearing with the axis inclination of the workpiece or the cutter axis. This is related to the need of producing a shaping cutter with internal teeth for each gear train so that its geometry would be identical to that of the spur gear in the gear train. The paper describes a method for shaping an approximate teeth profile of a bevel gear in a spur–bevel gearing with a rack-type tool. The proposed method provides a sufficient degree of approximation of the shaped surface to the theoretically accurate one, which makes it applicable. In the paper, the equations are presented describing the teeth surface, as a result of a two-parameter bending with a hob of the surface with conical billet for evaluation. This makes it possible to evaluate the degree of approximation received for the working surface of the teeth to the theoretically accurate surface.

1 Introduction

A spur–bevel gearing is a gear train, in which one of the gears has a cylindrical blank, and the other—a conical one [1–5]. To provide a linear teeth contact in the internal spur–bevel gearing, the generating gear in the cutter-blank meshing has to be an involute spur gear identical to the spur gear of the gear train [6–9].

2 Main Part

Figure 1 shows a diagram of the internal spur–bevel meshing with a generating involute spur gear. The teeth flank of the spur gear is an involute cylinder. This surface (see Fig. 1) in the moving reference frame $X_2Y_2W_2$, associated with the spur gear, is described by the equations:

$$\begin{aligned} X_2 &= r_{b2}[\sin(v_{y2} - \psi_{b2}) - v_{y2} \cdot \cos(v_{y2} - \psi_{b2})] \\ Y_2 &= r_{b2}[\cos(v_{y2} - \psi_{b2}) + v_{y2} \cdot \sin(v_{y2} - \psi_{b2})] \\ W_2 &= u, \end{aligned} \quad (1)$$

where r_{b2} is the radius of the base spur gear cylinder, v_{y2} is the roll angle of the involute curve, ψ_{b2} is half of the angular thickness of the tooth dedendum on the rolling circle of the spur gear, u is the z -coordinate of the face section of the spur gear.

Fig. 1 Meshing of the generating: 1—spur gear, 2—bevel gear

The angle v_{y2} for the given radius r_{y2} is determined by the expression

$$v_{y2} = \text{tg} \cdot \arccos\left(\frac{r_{b2}}{r_{y2}}\right). \quad (2)$$

The angle ψ_{b2} is calculated according to the dependence

$$\psi_{b2} = \frac{\pi}{2 \cdot z_2} + \frac{2 \cdot x_2 \cdot \text{tg} \alpha}{z_2} + \text{inv} \alpha \quad (3)$$

where x_2 is the profile shift coefficient of the spur gear.

The flank surface of the bevel gear teeth is an envelope of the generating surface and is non-involute [2]. This surface in the moving reference system $X_1Y_1W_1$, associated with the bevel gear is described by the equations:

$$\begin{aligned} X_1 &= r_{b1} [\cos \phi_2 (\sin \alpha_{\text{tw}} - v_{y1} \cos \alpha_{\text{tw}}) - \sin \phi_2 \cos \Sigma (\cos \alpha_{\text{tw}} + v_{y1} \sin \alpha_{\text{tw}})] \\ &\quad + u \sin \phi_2 \sin \Sigma \\ Y_1 &= r_{b1} [\sin \phi_2 (\sin \alpha_{\text{tw}} - v_{y1} \cos \alpha_{\text{tw}}) - \cos \phi_2 \cos \Sigma (\cos \alpha_{\text{tw}} + v_{y1} \sin \alpha_{\text{tw}})] \\ &\quad - u \cos \phi_2 \sin \Sigma \\ W_1 &= r_{b1} \sin \Sigma (\cos \alpha_{\text{tw}} + v_{y1} \sin \alpha_{\text{tw}}) + u \cos \Sigma \cos \alpha_{\text{tw}} = \cos(v_{y1} - \psi_{b1} - \phi_1) \\ &= \frac{r_{b1}}{u \cdot \text{tg} \delta_1}; \phi_1 = \phi_2 \cdot i_{12} \end{aligned} \quad (4)$$

where Σ is the shaft angle, α_{tw} is the gearing angle in the face section of the spur gear, ϕ_1 , ϕ_2 are the turning angles of the bevel gear and the spur gear.

Theoretically, exact flank surface of the bevel gear teeth can be formed by a shaping cutter with internal teeth. In this case, a geometrical gearing diagram of the internal conjugate spur–bevel meshing is implemented in the cutter-blank meshing. However, due to the complex manufacture of shaping cutters with internal teeth, this tool is not produced on the industrial level. Thus, currently it seems impossible to form a theoretically exact profile using this method.

An approximate profile can be shaped with gear-cutting equipment using a rack-type cutting tool [10]. In this case, the rack-type cutting tool (a milling cutter, a grinding wheel) moves along the blank gear axis according to a certain law. Such cutting is carried out by standard gear milling machines equipped with a follow-up device or by CNC machines. Figure 2 shows the cutting diagram. By selecting the cutter path, we can obtain a tooth similar in shape to the exact non-involute gear tooth [11, 12].

To calculate the coordinates of the envelope curve points, we used the mathematical apparatus of the involute bevel gearing developed by Bezrukov [13] and took the tool angle δ_{0i} as variable in each section. The tool shifting coefficient in an arbitrary face section of the bevel gear in the midpoint of the tooth depth is determined according to the expression.
