Suraj Mal, University of Delhi, Delhi, India

Michael E. Meadows, University of Cape Town, Rondebosch, South Africa

World leaders adopted Sustainable Development Goals (SDGs) as part of the 2030 Agenda for Sustainable Development. Providing in-depth knowledge, this series fosters comprehensive research on these global targets to end poverty, fight inequality and injustice, and tackle climate change.

The sustainability of our planet is currently a major concern for the global community and has been a central theme for a number of major global initiatives in recent years. Perceiving a dire need for concrete benchmarks toward sustainable development, the United Nations and world leaders formulated the targets that make up the seventeen goals. The SDGs call for action by all countries to promote prosperity while protecting Earth and its life support systems. This series on the Sustainable Development Goals aims to provide a comprehensive platform for scientific, teaching and research communities working on various global issues in the field of geography, earth sciences, environmental science, social sciences, engineering, policy, planning, and human geosciences in order to contribute knowledge towards achieving the current 17 Sustainable Development Goals.

This Series is organized into eighteen subseries: one based around each of the seventeen Sustainable Development Goals, and an eighteenth subseries, “Connecting the Goals,” which serves as a home for volumes addressing multiple goals or studying the SDGs as a whole. Each subseries is guided by an expert Subseries Advisor.

Contributions are welcome from scientists, policy makers and researchers working in fields related to any of the SDGs. If you are interested in contributing to the series, please contact the Publisher: Zachary Romano [Zachary.Romano@springer.com].

Foreword

I am pleased to write the foreword to this book, which covers the full breadth and width of the issue of addressing climate change and variability in Africa.

The authors have endeavoured to address the state-of-art in the modelling and understanding of climate change dynamics, which requires modelling and developing several tools to aid in the what-if-analysis of climate change, its impact, and the vulnerability and evaluation of adaptation measures/options. It is crucial that science is applied when addressing the challenges of creating a communication platform to advise policy makers in the area of climate change adaptation and institutional building.

I feel strongly that the book recognises the experience of project conceptualisation, planning and implementation. It includes a discussion of climate sensitivities and climate change mitigation measures alongside adaptation options using scientific and engineering knowledge infused with indigenous knowledge systems, which is both crucial and challenging.

This book was therefore conceived following consideration of the various challenges facing Africa in terms of the effects of climate change and variability, covering the following specific areas:

- Modelling and predicting climate change impacts
- Climate variability and predictability
- Understanding and predicting climate
- Regional downscaling and forecasting: uncertainty and verification
- Africa in a changing climate
- Adaptation strategies in the agricultural sector
- Adaptation strategies in the water sector

These issues were pooled to form the four major themes of the book:

- I. Climate variability and change
- II. Hydrology and water resources issues
- III. Agricultural issues
- IV. Policy and social issues

The focus areas of the book's 15 chapters in terms of the aforementioned topic areas are summarised in the table below.

In Part I of the book covering issues regarding climate variability and change, cases of climate change and its impact are presented in the following chapters:

1. Overview of Climate Variability and Change in Africa: Perspectives and Experiences
2. Change, Variability and Trend Analysis of Hydro-Climatic Time Series.
3. An Overview of Dynamical Downscaling of Global Reanalyses for Improved Climate Reconstruction Over Data-Sparse Regions
4. Evaluation of CMIP5 Climate Models for Precipitation Projections Over the Upper Blue Nile Basin

In Part II, covering hydrology and water resources issues, includes the following chapters:

5. Assessing Runoff Changes in Major Catchments in Swaziland Due to Climate Change
6. Impacts of Possible Climate Change and Variability on the Water Resources of Southern African: A Regional Modelling Approach
7. Framework of Best Practice for Climate Change Adaptation in Africa: The Water–Development Nexus
8. Groundwater Occurrence, Recharge and Productivity in Tertiary Volcanic Rocks of Ethiopia and Climate Change Implications
9. Relationships Among Surface Water Resources in the WR90, WR2005 and WR2012 Datasets of South Africa Using Mean Annual Runoff of Quaternary Catchments

Part III, focusing on agricultural issues, consists of the following chapters:

10. Integrated Assessment of Climate Change Impacts and Adaptation in Agriculture: The Case Study of the Wami River Sub-basin, Tanzania
11. Strengthening Horticultural Innovation Systems for Adaptation to Effects of Urbanisation and Climate Variability in Peri-Urban Areas
12. Evaluation of Different Tillage Systems for Improved Agricultural Production in Drought-Prone Areas of Malawi

Part IV, referring to social and political issues, involves the following chapters:

Chapter	Parts of Climate Change and Variability								Adaptation Strategies in the water sector
	Modelling and Predicting Climate Change Impacts	Climate Variability and Predictability	Understanding and Predicting Climate	Regional Downscaling and Forecasting: Uncertainty and Verification	Africa in a Changing Climate	Adaptation Strategies in the Agricultural Sector			
PART I									
Chapter 1	H	M	M	M	H	H	H	H	H
Chapter 4	M	H	H	H	M	M	L	L	L
Chapter 10	M	L	L	M	H	H	H	L	L
Chapter 11	M	L	L	M	H	H	H	L	L
PART II									
Chapter 3	M	L	L	M	M	M	L	L	H
Chapter 6	M	H	H	H	M	M	L	L	H
Chapter 7	H	H	H	H	M	M	L	L	L
Chapter 12	M	L	L	M	M	M	H	L	L
Chapter 13	M	H	H	H	M	M	L	L	L
PART III									
Chapter 2	M	L	L	M	H	H	H	L	L
Chapter 9	M	L	L	M	H	H	H	L	L
Chapter 8	M	H	H	H	M	M	L	L	H
PART IV									
Chapter 13	M	L	L	M	M	M	L	L	L
Chapter 14	M	L	L	L	M	M	M	M	H
Chapter 15	M	L	H	L	L	M	H	H	H

Note: H = High, M = Medium, L = Low

13. Africa in a Changing Climate: Redefining Africa's Agrarian Development Policies
14. Climate Change Adaptation Research and Policy for Agriculture in Southern Africa (CCARPASA)—Evidence from Rainfed Systems
15. Integrating Climate Change Adaptation and Mitigation into Sustainable Development Planning: The Policy Dimension

I have also noted that the book chapters and nexuses of climate change and variability are well correlated to illustrate the theory and practices of climate change and adaptation relevant to African conditions based on experiences of the authors who are domiciles in different parts of Africa.

This brings me to a concluding remark. In future, no single country will be able to address climate change alone and manage to develop adaptation and resilience in isolation. Climate change and adaptation systems do not follow political boundaries and a vast international pool of knowledge, technology and innovations will be required to achieve sustainable development and to realise the Sustainable Development Goals set forth by most countries in Africa—and the developing world in general.

I therefore welcome the book as a contribution to the ICSU Regional Office for Africa and its global environmental change program for ICSU being the initiator of this book, as well as an essential mobiliser of scientific research in the areas of climate change and variability, including adaptation issues in Africa.

Let me say finally: enjoy reading this book and contribute to the understanding of the impact of climate change on Africa's future.

Dr. Daniel Nyanganyura
Regional Director, ICSU
Regional Office for Africa
Pretoria, South Africa

Acknowledgements

This book contains a selection of chapters submitted by various authors from their respective institutions based on their wide experience in the area of climate change and variability in Africa. The editors of this book were able to use regional water dialogues, conferences and workshops in presenting various manuscripts, presentations and journal manuscript reviews. We appreciate the contributions that culminated in this book, intended for wide dissemination and outreach to young practitioners and policy makers that need to include wisdom in the integration of climate change and variability in the development planning of economies and infrastructure in order to cope with the challenges facing Africa.

The following individuals are gratefully acknowledged for their input, which enabled this book to be completed:

We would like to acknowledge the University of Swaziland, University of Botswana and the constructive discussions with our colleagues within the respective research groups on a wide range of issues regarding climate change and variability in Africa, as well as its impact and adaptation issues.

Our gratitude goes to Dr. K. Laletsang, Head of Department of Geology, University of Botswana, and the Directors of the Department of Water Affairs in Botswana and Swaziland, for their continuous encouragement and support during the compilation and editing of this book.

Our gratitude goes to Dr. Daniel Nyanganyura of the ICSU Regional Office for Africa (ROA), Pretoria Office, for his continuous encouragement and support during the compilation and editing of this book.

Publishing of this book was made possible through coordinated support from the ICSU Regional Office for Africa (ROA), Pretoria Office. Dr. Daniel Nyanganyura and Dr. Richard Glover, both from the ICSU ROA, are especially thanked for their advice and assistance. While many organisations have increasingly focused on global change issues, we gratefully acknowledge the ICSU ROA, for maintaining its interest in and support for the efforts of climate change research issues in Africa.

The three authors are members of Global Change Program of ICSU. They are indebted for the encouragement rendered by ICSU Regional Office for Africa and its secretariat in initiating the writing this book.

The second author was a fellow of the Africa Climate Leadership Program (AfriCLP) for period 2018–2020, which he greatly acknowledges AfriCLP that inspired the publication of this manuscript and other co-authored chapters in this book. AfriCLP is coordinated and sponsored by the

University of Nairobi, Institute of Resource Assessment of the University of Dar es Salaam and IDRC.

All the authors and their affiliated organisations are gratefully acknowledged for their technical input and kind support.

Prof. Jonathan I. Matondo

Prof. Berhanu F. Alemaw

Dr. Wennegouda Jean Pierre Sandwidi

Table 5.3	Estimates of changes in runoff (in %) in Swaziland and African rivers (IPCC 2001, 2007; Matondo et al. 2004).	52
Table 6.1	Mean 1961–1990 annual generated runoff by DGHM at ten selected grid cells in the SADC region, and the coefficient of variation of 30 years of simulated runoff according to three climate change scenarios	62
Table 6.2	Mean annual changes (%) in water balance components of Mlowo catchment [for 3 rainfall scenarios and UKTR/core scenario of PET, at a 0.5° region (8.5–9S/33.5–34E)] for the 2050s.	62
Table 6.3	Comparison between mean annual runoff changes at ten regional windows of 0.5° grids under the IS92a and IS92d emissions using the UKTR GCM experiment.	67
Table 9.1	Selected hydrological characteristics (in net values) of water management areas of South Africa	109
Table 9.2	Regression model fitting among WR90, WR2005 and WR2012, through quaternary catchments	111
Table 10.1	Growing season characteristics for selected stations in the Wami sub-basin	120

Table 10.2	Sensitivity of current agricultural production systems to climate change: vulnerable households, gains, losses and net economic impact (%) across GCMs	130
Table 10.3	Sensitivity of current agricultural production systems to climate change: Changes in poverty rates and per capita income. LHZ1 and LHZ2 indicate livelihood zones 1 and 2, respectively	131
Table 10.4	Impact of climate change on future agricultural production systems: Changes in poverty rates and per capita income. LHZ1 and LHZ2 indicate livelihood zones 1 and 2, respectively	131
Table 10.5	Benefits of climate change adaptations: adoption rates (%), and mean net farm returns with and without adaptation (USD)	132
Table 10.6	Benefits of climate change adaptations: Mean poverty rate (%) and per capita income (USD). Z1 and Z2 are mean value of livelihood zones 1 and 2, respectively	132
Table 11.1	Percentage of urban population in Southern Africa (1950–2050)	139
Table 11.2	Average annual population growth rates (%) of rural and urban areas in Malawi	139
Table 11.3	Mann–Kendall trends for the Ruo River, 1952–2002	145
Table 11.4	Crop treatment plots in Sitolo Village (with and without).	148
Table 11.5	Production of best technologies for one harvest	151
Table 11.6	Matrix scoring of practices or technologies by farmers in 2012	152
Table 12.1	Effects of tillage systems on mean leaf length and number of leaves per plant, at Mpasu village, Chikwawa, winter 2013.	164
Table 12.2	Influence of tillage systems on sorghum and maize plant heights, at Mpasu, Chikwawa, winter 2013	164
Table 12.3	Effects of tillage systems on sorghum and maize grain yields (kg/ha)	165
Table 14.1	Projected changes in temperature and precipitation during the baseline period in the study area	186
Table 14.2	Projected percentage yield reductions for the various scenarios	186
Table 14.3	Direct runoff that can be harvested for the baseline climatology	187
Table 14.4	Direct runoff that can be harvested under the three climate change scenarios in the 2050s for three rainfed cropping systems simulated using a coupled GCM–crop–water balance model	187
Table 15.1	Climate Compatible Development (CCD) strategies for change adaptation and mitigation in sustainable development planning	194

Table 15.2	Classification scheme of approaches that align with the three main components of Climate Compatible Development (CCD)	204
Table 15.3	Sectoral relevance of development planning and climate change in the implementation of CCD in selected countries	206
