Set in 10/12pt WarnockPro by SPi Global, Chennai, India

Since the publication of the first edition, three highly skilled field scientists who gave generously of their time and expertise for the first edition of this book have sadly passed away. All three were expert ecologists and each influenced many generations of young scientists.

We would like to dedicate this second edition to our friends and colleagues: Mike Hounsome, Rob Strachan, and Derek Yalden.

1 Preparation 1

Choosing a topic for study	2
Ecological research questions	4
Monitoring individual species and groups of species	4
Monitoring species richness	5
Monitoring population sizes and density	5
Monitoring community structure	6
Monitoring behaviour	6
A note of caution	6
Creating aims, objectives, and hypotheses	9
Reviewing the literature	9
Primary literature	10
Secondary literature	10
Other sources of information	11
Search terms	11
Reading papers	12
Practical considerations	12
Legal aspects	13
Ethical issues	13
Health and safety issues	14
Implementation	16
Equipment and technical support	19
Field/laboratory notebook	19
Pilot studies	21

Time management	22
Statistical considerations in project design	24
Designing and setting up experiments and surveys	26
Choosing sampling methods	26
Types of data	27
Sampling designs	29
Planning statistical analysis	35
Describing data	35
Asking questions about data	36
Predictive analysis	37
Multivariate analysis	38
Examining patterns and structure in communities	39
Summary	39
2 Monitoring Site Characteristics	43
Site selection	43
Site characterisation	44
Habitat mapping	44
Examination of landscape scale	54
Measuring microclimatic variables	55
Monitoring substrates	60
Monitoring water	64
Other physical attributes	67
Measuring biological attributes	70
Identification	76
3 Sampling Plants and Other Static Organisms	85
Sampling for static organisms	88
Seeds, fecundity, and population dynamics	91
Quadrat sampling	92
Density estimation using quadrats	95
Frequency estimation using quadrats	95
Cover estimation using quadrats	96
Biomass estimation within quadrats	97
Quadrat size	99
Nested quadrats	100
Placement of quadrats	101
Quadrat shape	102
Pin-frames	103
Transects	104
Plotless sampling	106
Distribution of static organisms	109
Forestry techniques	110
Tree diameter	110
Tree basal area	113
Height of trees	113
Timber volume	114

Growth	114
Canopy cover	115
Age and mortality	115
4 Sampling Mobile Organisms	119
General issues	120
Distribution of mobile organisms	123
Direct observation	124
Behaviour	124
Indirect methods	130
Capture techniques	130
Marking individuals	133
Radio-Tracking	136
Population dynamics	138
Invertebrates	140
Direct observation	141
Butterfly census method	141
Indirect methods	143
Using insect sounds	143
Capture techniques	144
Killing and preserving invertebrates	145
Marking individuals	145
Capturing aquatic invertebrates	150
Netting	152
Suction sampling	156
Benthic coring	156
Drags, dredges, and grabs	157
Wet extraction	158
Artificial substrate samplers	159
Baited traps and refuges	159
Capturing soil-living invertebrates	161
Sieving	161
Floatation and phase-separation	161
Tullgren funnels and similar methods of dry extraction	162
Chemical extraction	164
Electrical extraction	166
Capturing ground-active invertebrates	167
Pitfall traps	167
Suction samplers	175
Emergence traps	178
Capturing invertebrates from plants	180
Pootering	182
Sweep netting	184
Beating	185
Fogging	185
Capturing airborne invertebrates	187
Sticky traps	190

Using attractants	191
Refuges	194
Flight interception traps	195
Light traps	197
Rotary traps	205
Water (pan) traps	206
Fish	208
Direct observation	210
Indirect methods	211
Capture techniques	211
Nets and traps	212
Collecting fish larvae	215
Electrofishing	215
Marking individuals	215
Amphibians	218
Direct observation	221
Indirect methods	221
Counting egg masses	221
Using environmental DNA (eDNA)	222
Capture techniques	222
Sampling adults in water	223
Sampling adults on land	224
Tadpoles	226
Juveniles/metamorphs	226
Marking individuals	226
Reptiles	228
Direct observation	228
Indirect methods	229
Capture techniques	230
Hand-capture	232
Traps	233
Marking individuals	235
Birds	236
Direct observation	237
Timed species count	239
Common bird census/breeding bird survey	240
Point counts	241
Transect line counts	242
Distance sampling	242
Flush counts	244
Indirect methods	245
Counting nests at a distance	246
Bird song	247
Capture techniques	247
Mist netting	248
Propelled nets	250
Marking individuals	250

Mammals	253
Direct observation	254
Indirect methods	257
Capture techniques	264
Marking individuals	272
5 Analysing and Interpreting Information	275
Keys to tests	278
Exploring and describing data	285
Transforming and screening data	285
Graphical display of data	288
Measures of central tendency and sample variability	290
Spatial and temporal distributions	292
Population estimation techniques: densities and population sizes	292
Richness and diversity	297
Similarity, dissimilarity, and distance coefficients	297
Recording descriptive statistics	300
Testing hypotheses using basic statistical tests and simple general linear models	301
Differences between samples	304
Relationships between variables	307
Associations between frequency distributions	312
More advanced general linear models for predictive analysis	314
Multiple regression	314
Analysis of covariance and multivariate analysis of variance	316
Discriminant function analysis	318
Generalized linear models	319
Extensions of the generalized linear model	323
Extensions of generalized linear models and GAMs into mixed-effects models	324
Statistical methods to examine pattern and structure in communities: classification, indicator species, and ordination	325
Classification	325
Classification techniques when the number of groups is known	326
Significance testing for group membership: analysis of similarity (ANOSIM)	328
Classification techniques when the number of groups is unknown	329
Indicator species analysis	331
Ordination	332
Indirect gradient analysis	333
Comparing ordinations and matrix data	338
Direct gradient analysis	339
6 Presenting Information	343
Written reports	344
Title	345
Abstract	345

List of Tables

Table 1.1	Example timescales for a short research project.....	23
Table 1.2	Random numbers.....	33
Table 1.3	Common statistical tests.....	36
Table 2.1	Common factors influencing living organisms.....	45
Table 2.2	Types of bioindicators for monitoring environmental conditions.....	71
Table 2.3	Range of taxa used as bioindicators.....	72
Table 2.4	Major taxonomic groups.....	82
Table 2.5	Major divisions of the Raunkiær plant life-form system.....	83
Table 3.1	DAFOR, Braun–Blanquet, and Domin scales for vegetation cover.....	96
Table 3.2	Abundance (ESACFORN) scales for littoral species.....	98
Table 3.3	Recommended quadrat sizes for various organisms.....	100
Table 4.1	Some considerations in the choice of radio-tracking equipment.....	137
Table 4.2	Summary of killing and preservation techniques for commonly studied invertebrates.....	146
Table 4.3	Factors to consider when using pitfall traps.....	176
Table 4.4	Examples of baits and target insect groups.....	192
Table 4.5	Factors to consider when choosing light traps to collect moths.....	205
Table 4.6	Summary of different types of net.....	214
Table 4.7	Example of timed species counts.....	240
Table 4.8	Comparison of bat detector systems.....	261
Table 5.1	Abundance of invertebrates in ponds.....	290
Table 5.2	Summary of commonly used methods of population estimation based on mark–release–recapture techniques.....	295
Table 5.3	Common diversity and evenness indices.....	298
Table 5.4	Commonly used similarity measures.....	299
Table 5.5	Statistics that should be reported for difference tests.....	306
Table 5.6	Statistics that should be reported for relationship tests.....	308
Table 5.7	Statistics that should be recorded for tests used to examine associations between two frequency distributions.....	313

Table 5.8	Using dummy variables.....	315
Table 5.9	A spider indicator species analysis.....	331
Table 5.10	Types of stress measure for computing MDS solutions.....	337
Table 6.1	Mean number of individuals of invertebrate orders found in polluted and clean ponds.....	350
Table 6.2	Uses of different types of graphs.....	352
Table 6.3	Examples of words used unnecessarily when qualifying terms.....	361
Table 6.4	SI units of measurement.....	363
Table 6.5	Conventions for the use of abbreviations.....	364
Table 6.6	Examples of Latin and foreign words and their emphasis.....	366

List of Boxes

Box 1.1	Some sources of ecology projects	3
Box 1.2	Suggested minimum equipment required for fieldwork	15
Box 1.3	Keeping a field notebook	20
Box 1.4	Some tips on time management	23
Box 1.5	Differences between interval and ratio data	27
Box 1.6	Terms used in sampling theory	29
Box 1.7	Aspects to be considered when determining the sample size	30
Box 1.8	Species accumulation curves for two sites	31
Box 1.9	Checklist for field research planning	42
Box 2.1	Notes on the resources available for the National Vegetation Classification (NVC)	47
Box 2.2	Examples of vegetation classification systems	48
Box 2.3	An example of a code of practice for the use of drones	50
Box 2.4	Calculations of soil moisture and organic contents	61
Box 2.5	Measurements of freshwater invertebrates used in habitat quality and pollution monitoring	73
Box 2.6	Examples of identification guides for British insects	77
Box 3.1	Calculating population and density estimates from counts of static organisms	86
Box 3.2	Techniques used to identify and count microbial diversity	88
Box 3.3	Commonly used plotless sampling methods	107
Box 3.4	Describing the distribution of static organisms using quadrat-based methods	109
Box 3.5	Describing the distribution of static organisms using T-square sampling methods	110
Box 4.1	Avoiding problems in behavioural studies	128
Box 4.2	Butterfly census method	142
Box 4.3	Calculating the density of flying insects from census walks	143
Box 4.4	Taking account of missing traps	172

Box 4.5	Common birds census for territory mapping	240
Box 4.6	Restrictions on handling birds	248
Box 5.1	A note of caution about the examples used in this chapter	276
Box 5.2	Some commonly used statistical software	276
Box 5.3	Important terms used in the keys	279
Box 5.4	Some suggested statistical texts	280
Box 5.5	The Peterson (Lincoln index) method of population estimation	293
Box 5.6	Testing for significance when carrying out multiple tests	304
Box 5.7	Multiple comparison tests	307
Box 5.8	Using a contingency table in frequency analysis	313
Box 5.9	Analysis of covariance	316
Box 5.10	Using classification tables in predictive discriminant function analysis	318
Box 5.11	Generalized linear model: a worked example using a binomial regression	321
Box 5.12	Generalized additive model (GAM)	323
Box 5.13	Distance measurements	326
Box 5.14	Use of ANOSIM	329
Box 5.15	Examples of agglomerative clustering methods	330
Box 5.16	Using principal components analysis for data compression	333
Box 5.17	Using principal components analysis to produce biplots	335
Box 5.18	Example of distance placement using MDS	338
Box 5.19	Techniques for comparing ordinations and matrix data	339
Box 5.20	Example of use of canonical correspondence analysis	340
Box 6.1	Citing works using the Harvard system	355
Box 6.2	Reference lists using the Harvard system	357
Box 6.3	Commonly misused words	367

List of Case Studies

Case Study 1.2	Processing and transporting marine microbes from one of the most remote places on earth	17
Case Study 1.3	Monitoring dung beetle richness in East Africa	40
Case Study 2.1	Proximal sensing from lightweight drones	50
Case Study 3.1	The Park Grass experiment	93
Case Study 3.2	Studying tree growth and condition	111
Case Study 4.1	Using DNA metabarcoding to analyse the gut contents of spiders	121
Case Study 4.2	Cracking the chemical code in mandrills	125
Case Study 4.3	Barnacle larva trap	131
Case Study 4.4	Tarantula distribution and behaviour	147
Case Study 4.5	Stream invertebrates	150
Case Study 4.6	Collecting insects in Costa Rica	169
Case Study 4.7	Butterfly life cycles	180
Case Study 4.8	The birds and the bees	188
Case Study 4.9	Constructing low-cost moth traps	197
Case Study 4.10	Lake fish populations	216
Case Study 4.11	Breeding behaviour of neotropical tree frogs	219
Case Study 4.12	Reptile diet	230
Case Study 4.13	Counting parrots	243
Case Study 4.14	Bat conservation ecology	269
Case Study 6.1	Poster presentation	374

List of Plates

- Plate 1** A land cover map of Greater Manchester combining digitised and remotely-sensed data with detail on an area of South Manchester (inset)
- Plate 2** Environmental monitoring apps
- Plate 3** Examples of smartphone apps for species identification
- Plate 4** Alignment of sequences from several common terrestrial invertebrate orders at the sites of the original COI barcoding primers
- Plate 5** Bird markets
- Plate 6** Bird feeders
- Plate 7** Dormouse nest box
- Plate 8** Example of poster presentation

Preface to the Second Edition

Ecology is a rapidly evolving subject, not least in the techniques available to the field ecologist. Since the publication of our first edition of this project guide, advances have been made in several areas, most notably those that take advantage of modern technological developments. Whilst field ecologists have always sought to invent new methods and improve existing ones for monitoring plants and animals, new mobile technologies increasingly enable the tools for identification and verification of organisms to be literally in a researcher's back pocket. Similar advances in mobile phone apps have facilitated environmental monitoring, which has the potential to reduce the amount of equipment the researcher has to carry and perhaps go some way to providing standardisation of monitoring tools. There has been continued refinement of previously laboratory-based techniques that provide access to information more cheaply and immediately in the field where once we would have had to take samples back to sophisticated laboratories for analysis. Further developments in other technologies have opened up new and exciting opportunities to survey our environment (in the case of drone technology, the sky is literally the limit!). As these developments bed in, it is appropriate to review the tools available to field researchers.

We have extended this second edition to cover a wider range of methods, with a special focus on more recent developments, emphasising the direction of travel of modern field ecology. Following positive feedback from many students and colleagues, we have increased the number of case studies, which demonstrate the realities of working in the field. Developments have also been made recently in the analysis of ecological data, and this is reflected in a broader coverage of some of the more accessible techniques and available software. Since communication of scientific results is highly relevant in today's confusing mix of fact and opinion, we have also expanded our coverage of presentation skills to include publishing in scientific journals and presentation at conferences.

We have been privileged to have had expert advice and constructive criticism from a large number of experts who, in addition to the input to the first edition of this book, have reviewed the plans and implementation of the second edition, provided case studies and photographs, read and commented on individual sections, and generally encouraged us in our endeavours.
