

Reviews and critical articles covering the entire field of normal anatomy (cytology, histology, cyto- and histochemistry, electron microscopy, macroscopy, experimental morphology and embryology and comparative anatomy) are published in *Advances in Anatomy, Embryology and Cell Biology*. Papers dealing with anthropology and clinical morphology that aim to encourage cooperation between anatomy and related disciplines will also be accepted. Papers are normally commissioned. Original papers and communications may be submitted and will be considered for publication provided they meet the requirements of a review article and thus fit into the scope of "Advances". English language is preferred.

It is a fundamental condition that submitted manuscripts have not been and will not simultaneously be submitted or published elsewhere. With the acceptance of a manuscript for publication, the publisher acquires full and exclusive copyright for all languages and countries.

Twenty-five copies of each paper are supplied free of charge.

Manuscripts should be addressed to

Preface

Ume Eder Bat (A beautiful child) (popular song from Basque folklore)

The aim of this monograph is to introduce the postnatal development of morphological features that are relevant to readers interested in the neurobiology and pathology of the hippocampal formation in terms of the complex phenomena that underlie the progressive anatomical and functional maturation of this brain region. This review focuses on the morphological aspects, while more detailed basic phenomena associated with neuronal maturation—which are undoubtedly also of great interest—are only marginally referred to, although a selection of behavioral and clinical aspects will also be briefly addressed in an attempt to illustrate real situations in different clinical specialties.

The creation of this monograph is justified by the increasing importance and growing awareness shown in recent years of neurodevelopmental disorders in children. This awareness is leading to increasing refinement in clinical examinations of patients that may suffer from different neurodevelopment-related diseases, such as autism, epilepsy, memory disorders, etc. To the best of our knowledge, this work is the first comprehensive description of the postnatal changes in the hippocampal formation in its different constituent fields. Given the growing sensitivity and accuracy of neuroradiological examinations, particularly MRI, we also sought to offer a glimpse at the MRI aspects related to the development of the hippocampal formation in the human infant. Some caution must be exercised here, as our data deal with the anatomo-radiological correlation in *ex vivo* MRI images taken in fixed, normal human infant brains from routinely obtained necropsies in different hospitals across Spain. In this regard, we would like to show our appreciation of the uninterested help offered by the Pathology and Radiological Services of the Albacete University Hospital Complex (Drs. Atiénzar, Pascual, Cros and Mansilla, as well as their technician Francisca Cortés, who provided immensely valuable help), Drs. Tuñón and García-Bragado from Navarra's Department of Health, Dr. Rábano from Alcorcón Foundation Hospital, and we extend a very special thanks to the Pathology Service of Virgen del Rocío Hospital in Seville, in particular Drs.

Rivas, Chinchón and Fernández, for their tremendous help in providing human infant tissue.

This work is dedicated with kindness to those parents who gave their consent to perform necropsies on their beloved little ones at difficult moments. We hope that they will find comfort in the knowledge that their altruism will improve the health of other children.

Ricardo Insausti

P.S. To my inspiring mentor and friend, Prof. David G. Amaral, whose dedication to autistic children is an example of translational research, from basic science to clinical situations.

Acknowledgements

The authors wish to thank the great work carried out by the technical team of the Human Neuroanatomy Laboratory of the University of Castilla-La Mancha in Albacete (Spain), as well as the help of the technicians of the Virgen del Rocío Hospital in Seville (Spain) in the manipulation and preparation of the human brains and sections used in this study. This work has been supported by grants PI-2006/14 and PCI08-0113 by Junta de Comunidades de Castilla-La Mancha, Spain, and by grants FIS 01/0688 from the Ministry of Health, and G-2007_C/07 from FISCAM, JJCCM, Spain.

Abstract

The postnatal development of the human hippocampal formation (HF) is subject of increasing interest due to its implication in important pathologies that hamper the normal development of children. In this work, we present a glimpse of the main events that constitute important milestones in the development and shaping of some of the most important psychological capabilities such as autobiographical memory. We analyzed a total of 21 brains ranging from 27 gestational weeks to 14 years. Although we examined some cases in the last trimester of gestation, our description starts at birth, around 40 gestational weeks. Serial sections stained with thionin for Nissl analysis revealed that all fields of the HF were present and identifiable at birth. However, the relative growth of the cortical mantle was much higher relative to the HF. The main structural changes took place during the first postnatal year, in particular in the dentate gyrus and in the entorhinal cortex. At subsequent ages, a growth in size was noted in all components of the HF. This growth was more evident at the body and tail of the hippocampus, as evidenced by measurements of the neuroanatomical series. In addition, we examined in some cases the MRI appearance of the HF at different postnatal ages obtained by post-mortem imaging. MRI neuroanatomical series provided anatomically identified landmarks useful for the MRI identification of different components of the HF during postnatal development.

List of Contents

1	Introduction	1
2	Materials and Methods	5
3	General Organization of the HF Fields Related to Macroscopic Anatomy	9
3.1	Gross Anatomical Landmarks	9
4	Microscopic Anatomy of HF Fields	27
4.1	Dentate Gyrus	27
4.2	CA3	38
4.3	CA2	42
4.4	CA1	42
4.5	Subiculum	45
4.6	Presubiculum	48
4.7	Parasubiculum	51
4.8	Entorhinal Cortex	59
5	Correlation Between Anatomy and MRI	61
6	Functional and Pathological Aspects of the Maturation of the Human Hippocampal Formation	71
6.1	Human and Nonhuman Primate Memory Maturation, and Effect of HF Lesions	71
6.2	Hippocampal Growth	72
6.3	Hypoxia and Memory	75
6.4	Epilepsy and Medial Temporal Sclerosis	75
6.5	Schizophrenia, Bipolar Disorder, Autism, and Attention-Deficit/Hyperactivity Disorder	76
6.6	Developmental Delay	77
