[2.2 Oscillation of Mass with Two Degrees of
Freedom](#)

[2.3 Cross-Coupled Stiffness and Damping
Coefficients](#)

2.4 Summary

3 Characteristics of the Research Subject

3.1 Basic Technical Data of the Laboratory Test Rig

3.2 Analysis of Rotor Dynamics

3.3 Analysis of the Supporting Structure

3.4 Summary

4 Research Tools

4.1 Test Equipment

4.2 Test.Lab Software

4.3 Samcef Rotors Software

4.4 Matlab Software

4.5 MESWIR Series Software (KINWIR, LDW, NLDW)

4.6 Abaqus Software

5 Algorithms for the Experimental Determination of Dynamic Coefficients of Bearings

5.1 Development of the Calculation Algorithm

5.2 Verification of the Calculation Algorithm on the Basis of a Numerical Model

5.3 Results of Calculations of Dynamic Coefficients of Bearings

5.4 Summary

6 Inclusion of the Impact of an Unbalanced Rotor

6.1 Calculation Scheme

6.2 Definition of the Scope of Identification

6.3 Results of the Calculation of Dynamic Coefficients of Bearings Including Rotor Unbalance

6.4 Summary

7 Sensitivity Analysis of the Experimental Method of Determining Dynamic Coefficients of Bearings

[7.1 Method of Carrying Out a Sensitivity Analysis](#)

[7.2 Description of the Reference Model](#)

[7.3 Influence of the Stiffness of the Rotor Material](#)

[7.4 Influence of Uneven Force Distribution on Two Bearings](#)

[7.5 Changing the Direction of the Excitation Force and its Effect on the Results Obtained](#)

[7.6 Eddy Current Sensor Displacement Impact Assessment](#)

[7.7 Calculation Results for an Asymmetrical Rotor](#)

[7.8 Summary](#)

[8 Experimental Studies](#)

[8.1 Software Used for Processing of Signals from Experimental Research](#)

[8.2 Software Used for Calculations of Dynamic Coefficients of Bearings](#)

[8.3 Preparation of Experimental Tests](#)

[8.4 Implementation of Experimental Research](#)

[8.5 Processing of the Signal Measured During Experimental Tests](#)

[8.6 Results of Calculations of Dynamic Coefficients of Hydrodynamic Bearings on the Basis of Experimental Research](#)

[8.7 Verification of Results Obtained](#)

[8.8 Summary](#)

[9 Numerical Calculations of Bearing Dynamic Coefficients](#)

[9.1 Method of Calculating Dynamic Coefficients of Bearings](#)

[9.2 Calculation of Dynamic Coefficients of Bearings Using a Method with Linear Calculation Algorithm](#)

[9.3 Calculation of Dynamic Coefficients of Bearings Using a Method with Non-linear Calculation Algorithm](#)

[9.4 Verification of Results Obtained](#)

[9.5 Summary](#)

[10 Comparison of Bearing Dynamic Coefficients Calculated with Different Methods](#)

[11 Summary and Conclusions](#)

[Appendix A](#)

[A.1 Fast Fourier Transform Diagrams of Journal Displacement in Relation to Bearing Housings](#)

[A.2 Journal Vibration Trajectories in Relation to Bearing Housings](#)

[A.3 Acceleration of Vibrations of Bearing Supports during Start-up](#)

[A.4 Rotor Axial Alignment Report](#)

List of Figures

Figure 1.1	Lubrication film model for small journal displacement.
Figure 1.2	Methods of analysis for (a) small and (b) large displacement of the journal.
Figure 2.1	Bearing as part of a rotating system. Question marks indicate the places where dynamic coefficients of bearings occur.
Figure 2.2	Different bearing models: (a) oscillating mass with one degree of freedom; (b) bi-directional oscillating mass (two degrees of freedom); and (c) bi-directional oscillating mass with the inclusion of cross-coupled stiffness and damping coefficients.
Figure 2.3	Displacement of the mass attached to a fixed support by means of stiffness and damping coefficients as a result of a constant force.
Figure 2.4	The effect of a change in the damping coefficients on the displacement of the mass point which is being acted on by a constant force. The arrows represent the direction of displacement change due to the increase of damping coefficient values.
Figure 2.5	The effect of a change in the stiffness coefficients on the displacement of the mass point which is being acted on by a constant force. The arrows represent the direction of displacement change due to the decrease of stiffness coefficient values.
Figure 2.6	A single degree of freedom system with harmonic excitation.
Figure 2.7	The effect of a change in the damping coefficients on the displacement of the mass point which is

	being acted on by a constant harmonic with a frequency of 300 Hz.
Figure 2.8	The effect of a change in the stiffness coefficients on the displacement of the mass point which is being acted on by a constant harmonic with a frequency of 300 Hz.
Figure 2.9	Excitation force of constant value and of variable value changing along with frequency.
Figure 2.10	The relationship between the excitation force frequency and the amplitude of the system response for a constant force F .
Figure 2.11	The relationship between the excitation force frequency and the amplitude of the system response for the force F variable along with frequency.
Figure 2.12	Impact of damping coefficients.
Figure 2.13	Impact of stiffness coefficients.
Figure 2.14	Impact of mass coefficients.
Figure 2.15	Areas of influence of different types of coefficients for variable amplitude values of excitation force.
Figure 2.16	Areas of influence of different types of coefficients for the constant amplitude of excitation force.
Figure 2.17	Combination of oscillation in two directions taking into account the main stiffness and damping coefficients of the bearing.
Figure 2.18	Two-directional displacement and trajectories: (a) $c_{xx} = c_{yy} = 6400 \text{ N}\cdot\text{s}/\text{m}$; (b) $c_{xx}\cdot 2$; and (c) $c_{yy}\cdot 2$.
Figure 2.19	Combination of oscillation in two directions taking into account the main and cross-coupled stiffness

	and damping coefficients of the bearing.
Figure 2.20	Trajectory changes: (a) c_{xy} and $c_{yx} = 0 \text{ N}\cdot\text{s/m}$; (b) $c_{xy} = 0 \text{ N}\cdot\text{s/m}$ and $c_{yx} = 6400 \text{ N}\cdot\text{s/m}$; and (c) $c_{xy} = 0 \text{ N}\cdot\text{s/m}$ and $c_{yx} = 6400 \text{ N}\cdot\text{s/m}$.
Figure 2.21	Trajectory changes: (a) k_{xy} and $k_{yx} = 0 \text{ N/m}$; (b) $k_{xy} = 6\,630\,000 \text{ N/m}$ and $k_{yx} = 0 \text{ N/m}$; and (c) $k_{xy} = 0 \text{ N/m}$ and $k_{yx} = 6\,630\,000 \text{ N/m}$.
Figure 3.1	Photograph of the laboratory test rig.
Figure 3.2	Diagram of the laboratory test rig.
Figure 3.3	(a) Hydrodynamic bearing and (b) bearing diagram.
Figure 3.4	Run-up of the laboratory test rig; during 66.4 seconds the speed was increased linearly from 1000 to 8400 rpm.
Figure 3.5	Maximum displacement of the rotor journals.
Figure 3.6	Stable operation of bearings no. 1 (a and b) and no. 2 (c and d) at 3250 rpm; the diagrams show the signal recorded in X (a and c) and Y (b and d) directions; the short time interval (0.3 seconds) shows approximately 8 revolutions.
Figure 3.7	Stable operation of bearings no. 1 (a and b) and no. 2 (c and d) at 3250 rpm; the diagrams show the signal recorded in X (a and c) and Y (b and d) directions during 10 seconds.
Figure 3.8	FFT analysis of the stable operation signal from eddy current sensors bearings no. 1 (a and b) and no. 2 (c and d) at 3250 rpm; the diagrams show the signal measured in X (a and c) and Y (b and d) directions.
