FOREWORD

The concept for this book project grew out of a mutual recognition for the need of stronger interdisciplinary collaboration in sustainable energy studies. It is the result of in-depth discussions about early stage fuel cell technology governance between scientists from very different disciplinary backgrounds, broadly including materials science, engineering, sociology, and political science (although it should be noted that disciplinary labels are becoming less relevant in modern academia).

In particular, an interdisciplinary “back casting” exercise crystallized some of the concepts that are followed through in this book. During these exchanges the need to “translate” disciplinary language and jargon for a non-specialist audience was quickly realized, as well as the need to develop a common analytical framework to enable a fruitful interdisciplinary collaboration. This is reflected in the structure of the book, which introduces the reader to relevant aspects of fuel cells, critical raw materials (CRMs), and governance in short, dedicated chapters in a way that is hopefully understandable to different portions of the disciplinary spectrum.

This approach of course has limitations, since the scope is rendered by only four individuals and does not allow for active participation from other actors. While we acknowledge these shortcomings, we hope this text provokes a more profound discussion on anticipative governance strategies to address CRM issues in future sociotechnical pathways related to fuel cells.

Fukuoka, Japan

Stephen M. Lyth

CONTENTS

1	Introduction	1
1.1	<i>Climate Change and Decarbonization</i>	1
1.2	<i>Electrification and Energy Storage</i>	2
1.3	<i>Critical Raw Materials</i>	4
1.4	<i>The Hydrogen Economy</i>	6
1.5	<i>Fuel Cells</i>	9
1.6	<i>Critical Raw Materials in Fuel Cells</i>	9
1.7	<i>Governance of CRMs</i>	10
1.8	<i>Structure of This Book</i>	11
	<i>References</i>	11
2	Critical Raw Materials	15
2.1	<i>Defining CRMs</i>	15
2.2	<i>CRMs in Sustainable Energy Technologies</i>	18
2.3	<i>Case Study: Cobalt in Lithium-Ion Batteries</i>	21
2.4	<i>Factors Increasing CRM Supply Risks</i>	22
2.5	<i>The EU Action Plan on CRMs</i>	25
2.6	<i>CRMs in Fuel Cell Technologies</i>	26
2.7	<i>Future-Proofing Fuel Cells</i>	27
	<i>References</i>	27
3	Critical Raw Materials in Polymer Electrolyte Fuel Cells	35
3.1	<i>What is a Polymer Electrolyte Fuel Cell?</i>	35
3.2	<i>History of PEFCs</i>	38

3.3	<i>Modern Fuel Cell Electric Vehicles (FCEVs)</i>	39
3.4	<i>Comparing PEFCs and Li-Ion Batteries</i>	42
3.5	<i>Platinum in PEFCs</i>	45
3.6	<i>CRM Avoidance in PEFCs</i>	47
3.7	<i>Ultra-Low Platinum Loading</i>	49
3.8	<i>Platinum Nanoparticle Shape Control</i>	50
3.9	<i>Platinum Alloys</i>	51
3.10	<i>Issues with Decreasing the Platinum Loading</i>	51
3.11	<i>Recycling</i>	52
3.12	<i>Platinum-Free Catalysts</i>	52
3.13	<i>Chapter Conclusion</i>	53
	<i>References</i>	53
4	Critical Raw Materials in Solid Oxide Fuel Cells	57
4.1	<i>History and Overview of Solid Oxide Fuel Cells (SOFCs)</i>	57
4.1.1	<i>Early Development</i>	57
4.1.2	<i>Operating Principles and Components</i>	58
4.1.3	<i>Advantages and Disadvantages</i>	60
4.2	<i>Material Choices in SOFCs</i>	62
4.2.1	<i>Electrolytes</i>	62
4.2.2	<i>Cathodes</i>	63
4.2.3	<i>Anodes</i>	64
4.2.4	<i>Interconnects</i>	65
4.2.5	<i>Geometries and Fabrication</i>	65
4.3	<i>Commercial Production and Applications of SOFCs</i>	67

Introduction

1.1 CLIMATE CHANGE AND DECARBONIZATION

The burning of fossil fuels releases carbon dioxide into the atmosphere. This greenhouse gas causes climate change, which is the biggest threat to the survival of our species. In 1997, the urgency of this issue was recognized at the United Nations Framework Convention on Climate Change (UNFCCC), in the form of the Kyoto Protocol. This formed the cornerstone of international climate policy. In 2015, the international community negotiated the landmark Paris Agreement, which entered into force in 2016 and committed the signatory UN member states to hold “the increase in the global average temperature to well below 2 °C above pre-industrial levels and pursuing efforts to limit the temperature increase to 1.5 °C above pre-industrial levels” (UNFCCC, 2015, S. 3). Around the same time, the Agenda for Sustainable Development, with its 17 Sustainable Development Goals (SDGs), was agreed upon. SDG 7 was specifically formulated to ensure access to affordable, reliable, sustainable, and modern energy for all people in the world by 2030 (UN, 2015). These agreements have framed current efforts to deploy renewable energy technologies for decarbonization in the ongoing global energy transition.

However, progress on decarbonization of the world’s energy systems has been slow, and global energy demand is set to increase even further. The International Energy Agency (IEA) recently stated that “the pace and scale of the global clean energy transition is not in line with climate
