## Contents

**About the Editors** *xiii*

**List of Contributors** *xv*

**Foreword** *xxi*

**Preface** *xxii*

### **Section I Sustainable Natural Resource Management 1**

#### **1 Impact of Local REDD+ Intervention on Greenhouse Gas Emissions in East Kalimantan Province, Indonesia 3**

*Kiswanto, Martiwi Diah Setiawati, and Satoshi Tsuyuki*

1.1 Introduction 3

1.1.1 Tropical Deforestation 3

1.1.2 REDD+ 3

1.1.3 REDD+ in Indonesia 4

1.2 Materials and Methods 5

1.2.1 Spatial Dataset 5

1.2.2 Carbon Stock in Each Land Cover Class 5

1.2.3 Change in Carbon Stock and CO<sub>2</sub> Emission 7

1.2.4 Historical Baselines and Future Trajectories 7

1.3 Results 8

1.3.1 Annual GHG Emissions 8

1.3.2 Historical Baselines and Future Trajectories 9

1.4 Discussion 10

1.5 Conclusions 12

Acknowledgement 12

Author Contribution 12

List of Appendix 13

References 14

#### **2 Role of Geospatial Technologies in Natural Resource Management 19**

*Abhishek K. Kala and Manoj Kumar*

2.1 Introduction 19

2.2 Applications of Geospatial Technology in Natural Resource Management 20

|       |  |    |
|-------|--|----|
| 2.2.1 | Forest Management  | 20 |
| 2.2.2 | Water Resource Management  | 21 |
| 2.2.3 | Water Quality Monitoring   | 22 |
| 2.2.4 | Agriculture  | 23 |
| 2.2.5 | Combating Desertification  | 25 |
| 2.2.6 | Biodiversity Management  | 25 |
| 2.3   | LiDAR Technology   | 26 |
| 2.4   | Artificial Intelligence and Remote Sensing                             | 26 |
| 2.5   | Machine Learning Tools for Natural Resource Management                 | 27 |
| 2.6   | Applications of Unmanned Aerial Systems in Natural Resource Management | 28 |
| 2.7   | Google Earth Engine as a Platform for Environmental Monitoring and NRM | 29 |
| 2.8   | Conclusion   | 29 |
|       | References   | 30 |

### **3 Estimation of Snow Cover Area Using Microwave SAR Dataset 35**

*Shafiyoddin B. Sayyad and Mudassar A. Shaikh*

|         |  |    |
|---------|--|----|
| 3.1     | Introduction   | 35 |
| 3.2     | Classification Technique                               | 36 |
| 3.2.1   | Unsupervised Classification                            | 36 |
| 3.2.1.1 | H A Alpha Unsupervised Classification                  | 36 |
| 3.2.1.2 | Wishart H A Alpha Unsupervised Classification          | 37 |
| 3.2.2   | Supervised Classification                              | 37 |
| 3.2.2.1 | Wishart Supervised Classification                      | 38 |
| 3.2.2.2 | Support Vector Machine (SVM) Supervised Classification | 38 |
| 3.3     | Statistical Parameters                                 | 39 |
| 3.3.1   | Mean   | 39 |
| 3.3.2   | Standard Deviation                                     | 40 |
| 3.3.3   | Coefficient Variance                                   | 40 |
| 3.3.4   | Equivalence Number of Looks (ENL)                      | 40 |
| 3.4     | Error and Accuracy Assessment                          | 40 |
| 3.4.1   | Confusion Matrix                                       | 41 |
| 3.4.2   | Commission Error                                       | 41 |
| 3.4.3   | Omission Error   | 42 |
| 3.5     | Study Area   | 42 |
| 3.6     | Methodology  | 43 |
| 3.7     | Result and Discussion                                  | 44 |
| 3.8     | Conclusion and Future Perspective                      | 52 |
|         | References   | 52 |

## **Section II Determinants of Forest Productivity 57**

### **4 Forest Cover Change Detection Across Recent Three Decades in Persian Oak Forests Using Convolutional Neural Network 59**

*Alireza Sharifi, Shilan Felegari, Aqil Tariq, and Saima Siddiqui*

|     |                       |    |
|-----|-----------------------|----|
| 4.1 | Introduction          | 59 |
| 4.2 | Materials and Methods | 61 |

- 4.2.1 Study Area 61
- 4.2.2 Dataset 61
- 4.2.3 Image Pre-processing 64
- 4.2.4 Image Classification 64
- 4.3 Results and Discussion 65
- 4.4 Conclusion and Future Prospects 68
- References 69

## **5 The Interlinked Mechanisms of Productivity for Developing Process-Based Forest Growth Models 74**

*Keshav Tyagi, Manoj Kumar, Sweta Nisha Phukon, Abhishek Ranjan, Pavan Kumar, and Ram Kumar Singh*

- 5.1 Introduction 74
- 5.2 Productivity: Definition and Associated Components 76
- 5.3 Various Processes and Components Driving Forest Productivity 77
  - 5.3.1 Photosynthesis 78
  - 5.3.2 Light Interception 79
  - 5.3.3 Stomatal Conductance 79
  - 5.3.4 Leaf Area Index 79
  - 5.3.5 Gas-Exchange 80
  - 5.3.6 Plant Respiration 80
  - 5.3.7 Hydrology 81
  - 5.3.8 Nitrogen Cycle 81
  - 5.3.9 Litterfall 81
- 5.4 Different Approaches to Productivity Assessment 82
- 5.5 Evolution of Process-Based Models 83
- 5.6 Conclusion 84
- References 84

## **6 Allometric Equations for the Estimation of Biomass and Carbon in the Sub-tropical Pine Forests of India 89**

*Harshi Jain, Keshav Tyagi, Akshay Paygude, Pavan Kumar, Ram Kumar Singh, and Manoj Kumar*

- 6.1 Introduction 89
  - 6.1.1 Species of Pine in India and its Associates 91
  - 6.1.2 Uses of Chirpine 91
- 6.2 Chir Pine – a Boon or Bane? 92
- 6.3 Forest Carbon and Forest Biomass 93
- 6.4 Composition of Forest Biomass 94
  - 6.4.1 Indian Forest Biomass and Carbon Estimates 94
  - 6.4.2 Importance of Forest Biomass Estimation 95
- 6.5 Allometric Equations for Biomass Estimation 96
  - 6.5.1 How Are Allometric Equations Developed? 96
- 6.6 Biomass and Carbon Stock Estimation in Chir Pine Forests of India Using Allometric Equations 97
- 6.7 Conclusion 101
- References 102

### Section III Agriculture and Climate Change 109

#### 7 Characterization of Stress-Prone Areas for Dissemination of Suitable Rice Varieties and their Adoption in Eastern India: An Integrated Approach toward Food Security 111

*Sk Mosharaf Hossain, Devi Dayal Sinha, and Swati Nayak*

- 7.1 Introduction 111
- 7.1.1 Characterization of Stress-Prone (Flood and Drought) Areas in Eastern India: Geo-Spatial Based Studies (Submergence and Drought) 112
- 7.1.2 Eastern India (Submergence Study – Assam) 114
- 7.1.3 Eastern India (Drought Study – Uttar Pradesh) 115
- 7.1.4 Rice-Growing Environments in India and Constraints 116
- 7.1.5 Abiotic Stress in the Context of Rice Production 117
- 7.2 Materials and Method (for Submergence-prone: Assam) 118
- 7.3 Results and Discussion 120
- 7.4 Conclusions 127
- References 128

#### 8 Farmers' Perspective and Adaptation Efforts to Tackle the Impacts of Climate Change 132

*Shivani Mehta and Shridhar Samant*

- 8.1 Introduction 132
- 8.2 Methodology 135
- 8.3 Results and Analysis 137
- 8.3.1 Trends in Rainfall Patterns 137
- 8.3.1.1 Trends in Annual Rainfall 137
- 8.3.1.2 Trends in Rainy Days 140
- 8.3.1.3 Trends in Actual and Normal (Expected) Rainfall for Every Month 144
- 8.3.2 Impact of Climate Change on Farmers 148
- 8.3.2.1 Demographic Profile of the Respondents 148
- 8.3.2.2 Livelihood 148
- 8.3.2.3 Pests and Diseases 149
- 8.4 Understanding the Farmer's Perception of Climate Change 149
- 8.5 Adaptation Efforts 150
- 8.6 Conclusion 151
- References 152

### Section IV Water Resource Management and Riverine Health 157

#### 9 Multicriteria Drought Severity Analysis in Monaragala District Sri Lanka by Utilizing Remote Sensing and GIS 159

*K.U.J. Sandamali, K.A.M. Chathuranga, B.A.S.C. Kumara, and D.K.D.A. Ranaweera*

- 9.1 Introduction 159
- 9.2 Methodology 162
- 9.2.1 Study Area 162

|           |  |            |
|-----------|--|------------|
| 9.2.2     | Data Sources and Data Collection Techniques  | 163        |
| 9.3       | Meteorological Drought of Monaragala District  | 164        |
| 9.4       | Agricultural Drought of Monaragala District  | 167        |
| 9.4.1     | Normalized Difference Vegetation Index (NDVI)  | 167        |
| 9.4.2     | Vegetation Condition Index (VCI)   | 167        |
| 9.5       | Hydrological Drought of Monaragala District  | 169        |
| 9.6       | Drought Risk Area Map of Monaragala District   | 173        |
| 9.7       | Conclusion and Recommendations   | 177        |
| 9.8       | Conclusion   | 177        |
| 9.9       | Recommendation   | 179        |
|           | References   | 180        |
| <b>10</b> | <b>Comparative Evaluation of Predicted Hydrologic Response Under Two Extremities of Sustainability Using Transformed Landuse-Landcover and CORDEX-Based Climatic Scenarios: A Case Study of Kangshabati River Basin, West Bengal</b> | <b>183</b> |
|           | <i>Shreyashi Santra Mitra, Akhilesh Kumar, Abhisek Santra, and Shidharth Routh</i>   |            |
| 10.1      | Introduction   | 183        |
| 10.2      | A Brief Account of the Kangshabati River Basin, the Study Area   | 185        |
| 10.3      | Data and Methodological Description  | 187        |
| 10.3.1    | Model Data Input   | 187        |
| 10.3.2    | Land Change Scenarios Using Idrisi Land Change Modeler (LCM)   | 190        |
| 10.3.3    | SWAT Model Setup for Simulating Hydrologic Responses   | 194        |
| 10.4      | Results and Observations   | 195        |
| 10.4.1    | Trends in Climatic Indicators  | 195        |
| 10.4.2    | Trends in Land Use and Land Cover Change Scenarios   | 198        |
| 10.4.3    | Trends in Volumetric Runoff  | 204        |
| 10.4.4    | Trends in Surface Runoff   | 209        |
| 10.5      | Conclusion   | 214        |

| 11.2.3    | Statistical Analysis   | 224        |
| 11.2.3.1  | Cluster Analysis   | 224        |
| 11.2.3.2  | Correlations Between Land Use Classes and Water Quality Parameters   | 225        |
| 11.3      | Result and Discussion  | 225        |

- 11.3.1 Land Use and Water Quality 225
- 11.3.2 Land Use and Biodiversity 227
- 11.3.3 Land Use and Societal Perceptions 228
- 11.3.3.1 Livelihood Earners Perceptions 228
- 11.3.3.2 Tourists' Perception 229
- 11.4 Conclusions 231
- References 231

## **Section V Climate Change Threat on Natural Resources 237**

### **12 Socio-Economic Impacts of Climate Change 239** *Shubhi Patel, Anwasha Dey, Shani Kumar Singh, Rakesh Singh, and H.P. Singh*

- 12.1 Introduction 239
- 12.2 Trends in Climate Variables 240
- 12.3 Welfare Impact of Climate Change 242
- 12.4 Impact on Agriculture 244
- 12.5 Impact of Climate Change on Society 246
- 12.5.1 Food Security 246
- 12.5.2 Labor Productivity 247
- 12.5.3 Health and Nutrition 248
- 12.5.4 Adaptation Risk and Potential 248
- 12.6 Conclusion 262
- References 263

### **13 The Political Economy of Vulnerable Environment in the Age of Climate Change: A Kerala Experience 268** *P. Ratheesh Mon*

- 13.1 Introduction 268
- 13.2 Climate Change in Kerala 269
- 13.3 Climate and Sea Level Change Projections 270
- 13.4 Natural Disasters Associated with Climate Change 270
- 13.5 The Political Economy of Climate Change and Associated Disasters 273
- 13.6 Who Are the Affected? 275
- 13.7 Conclusion and Suggestions 276
- References 276

### **14 Land Use/Land Cover (LULC) Changes in Cameron Highlands, Malaysia: Explore the Impact of the LULC Changes on Land Surface Temperature (LST) Using Remote Sensing 279** *Mohd Hasmadi Ismail, Darren How Jin Aik, Mohamad Azani Alias, Farrah Melissa Muharam, and Pakhriazad Hassan Zaki*

- 14.1 Introduction 279
- 14.2 Effectiveness of Usage of Satellite Imagery in Land Use/Land Cover (LULC) Change 281
- 14.3 The Impact of LULC Changes on Land Surface Temperature (LST) 282

- 14.4 Methodology 283
- 14.4.1 Cameron Highlands 283
- 14.4.2 Data Collection 284
- 14.4.3 Field Verification 284
- 14.4.4 Image Processing 285
- 14.5 Land Use/Cover Changes in Cameron Highland from 2009 to 2019 287
- 14.5.1 Accuracy Assessment 290
- 14.6 Land Surface Temperature Analysis of Comparative Sensors between Landsat Satellite Data and MODIS 291
- 14.7 The LULC Effect on LST in Cameron Highlands 292
- 14.8 Conclusions 296
- References 297

## **Section VI Linkages between Natural Resources and Biotic-Abiotic Stressors 303**

- 15 Emerging Roles of Osmoprotectants in Alleviating Abiotic Stress Response Under Changing Climatic Conditions 305**  
*Debasish Pattnaik, Deepali Dash, Ankita Mishra, Aditya Kiran Padhiary, Prajjal Dey, and Goutam Kumar Dash*
- 15.1 Introduction 305
- 15.2 Role of Osmoprotectant Under Abiotic Stress 306
- 15.3 Role of Osmoprotectants Under Drought Stress 306
- 15.4 Role of Osmoprotectants Under Salinity Stress 307
- 15.5 Role of Osmoprotectants Under Cold Stress 307
- 15.6 Role of Osmoprotectants Under Submergence Stress 308
- 15.7 Role of Osmoprotectants Under Low Light Stress 308
- 15.8 Mechanisms of Osmoprotectants Under Multiple Abiotic Stress 309
- 15.9 Approaches to Improve Osmoprotectants to Confer Abiotic Stress Tolerance 313
- 15.10 Metabolic Engineering Approach 315
- 15.11 Future Prospect for Osmoprotectants Under Changing Climatic Conditions 316
- References 316
- 16 Growth Variability of Conifers in Temperate Region of Western Himalayas 325**  
*Ufaid Mehraj, Akhlaq Amin Wani, Aasif Ali Gattoo, Mohammd Ajaz-ul-Islam, Shah Murtaza Mushtaq, Amir Farooq, Immad Ahmad Shah, and Tariq Hussain Masoodi*
- 16.1 Introduction 325
- 16.2 Material and Methods 326
- 16.2.1 Study Area 326
- 16.2.2 Collection of Core Samples 326
- 16.3 Results 328
- 16.4 Discussion 332
- 16.4.1 Species-Wise 332
- 16.4.2 Site-Wise 332

- 16.4.3 Diameter Class-Wise 333
- 16.5 Conclusion 333
- References 334

**17 Process-Based Carbon Sequestration Study with Reference to the Energy-Water-Carbon Flux in a Forest Ecosystem 336**

*Hukum Singh*

- 17.1 Introduction 336
- 17.2 Concept of Soil-Vegetation-Atmosphere-Transfer (SVAT) 338
- 17.3 History of Flux Measurements and Recent Advances-Different Methods 339
- 17.4 Exchange Flux Measurements over Forest Ecosystems 340
- 17.4.1 Fast Response System: Eddy Covariance or Eddy Correlation Measurements 341
- 17.4.2 Slow-Response System 341
- 17.4.2.1 Bowen Ratio Measurements 341
- 17.4.2.2 Aerodynamic Flux Profile Method 342
- 17.5 Ecosystem Flux Measurements Network Worldwide and Indian Scenario 343
- 17.5.1 The Worldwide Network: The FLUXNET 343
- 17.5.2 Scenario in India and Prospects 344
- 17.5.3 The Proposed Concept of IndoFlux 345
- 17.6 State of the Current Knowledge at Forest Research Institute, Dehradun 345
- 17.7 Research Gaps and Future Needs 346
- 17.8 Conclusion 347
- References 347

## About the Editors

**Dr. Pavan Kumar** is a faculty member at the College of Horticulture and Forestry, Rani Lakshmi Bai Central Agricultural University, Jhansi, U.P., India. He obtained his Ph.D degree from the Faculty of Natural Sciences, Jamia Millia Islamia, New Delhi. He did BSc (Botany) and MSc (Environmental Science) at Banaras Hindu University, Varanasi, India and subsequently obtained a Master's degree in Remote Sensing (M. Tech) from Birla Institute of Technology, Mesra Ranchi, India. His current research interests include resilient agriculture and climate change studies. He is a recipient of an Innovation China National Academy Award for Remote Sensing. Dr. Kumar has published 50 research papers in international journals and authored several books. He has visited countries like USA, France, the Netherlands, Italy, China, Indonesia, Brazil, and Malaysia for various academic/scientific assignments, workshops, and conferences. Dr. Kumar is a member of the International Association for Vegetation Science, USA and the Institution of Geospatial and Remote Sensing, Malaysia.

**Dr. Ram Kumar Singh** works with Hexagon Geospatial to provide innovative geospatial solutions in the capacity of Deputy Manager. Dr. Singh is also affiliated to the TERI School of Advanced Studies New Delhi as a senior researcher. He earned a Ph.D in Natural Resources from the Department of Natural Resources, TERI School of Advanced Studies New Delhi. He obtained M.Sc. in Remote Sensing and GIS from the Symbiosis Institute of Geoinformatics, Pune, India and an Engineering in Electronics and Instrumentation degree from Samrat Ashok Technological Institute, Vidisha, India. Dr. Singh has worked on remote sensing applications as a Research Fellow in the National Informatics Centre, New Delhi. Dr. Singh has authored several peer-reviewed scientific research papers and presented works at many national and international conferences. Dr. Singh is an adjunct faculty for teaching M.Sc. Environment Management and Forestry, along with the Ph.D course at the Forest Research Institute Deemed to be University, Dehradun, India. Dr. Singh is a member of the American Geophysical Union, Washington, D.C., United States and the European Geosciences Union, Munich, Germany.

**Dr. Manoj Kumar** is a senior scientist working as In-charge of GIS Centre at the Forest Research Institute (FRI), Dehradun, India. The FRI is a premier research institute of the Government of India credited with initiating forestry research in the Asia Pacific region after its establishment in 1905 as the Imperial Forest Research Institute. Dr. Kumar primarily works in the field of forestry, environment, climate change, and related interdisciplinary fields with wider applications of Information Technology, Remote Sensing and GIS tools

with a working experience of more than 15 years. He has initiated work on developing forest growth simulation model to study functional relationship of plants with the environment that could be used for climate change impact studies and has published high-impact international papers on various themes of agriculture, forestry, environment and climate change. He has successfully implemented more than 20 research projects funded by national and international agencies.

**Dr. Meenu Rani** is a senior research fellow in the Department of Geography, Kumaun University, Nainital, Uttarakhand, India. Dr. Rani received her M. Tech degree in Remote Sensing from Birla Institute of Technology, Ranchi, India. She has working experience in the major disciplines of agriculture and forestry while working with Haryana Space Application Centre, Indian Council of Agricultural Research and GB Pant National Institute of Himalayan Environment and Sustainable Development. Dr. Rani has authored several peer-reviewed scientific research papers and presented works at many national and international conferences in the USA, Italy, and China. She has been awarded with various fellowships from the International Association for Ecology, Future Earth Coast, and the SCAR Scientific Research Programme. She was awarded early career scientists achievement in 2017 at Columbia University, New York, USA.

**Dr. Pardeep Sharma** is a Assistant Professor in Department of Geography, GCW, Hisar (Haryana) India. Dr. Sharma completed his Bachelors in Geography and subsequently obtained his Master's degree in Geography. He specialized in remote sensing and GIS and hydrological studies. His area of interest includes coastal ecosystem conservation and management, climate change, and disaster management. He has made a remarkable contribution in water-related researches such as coastal landscape vulnerability and flood vulnerability. He has presented his research at various national and international conferences.

## Foreword

Climate change refers to any distinct behavior in measures of climate such as temperature, rainfall, snow, or wind patterns lasting for decades. Over the past several years, the international and national research communities have developed a progressively clearer picture of how and why Earth's climate is changing and of the impacts of climate change on a wide range of human and environmental systems. Natural resources and their management form a critical interface between climate change and development. The impacts of climate change can affect the quality and reliability of many of the services that natural resources provide. On the other hand, natural resources play an important role in greenhouse gas mitigation and also serve as a first line of defense against climate change.

This book covers a wide range of strategies that can be applied to various sectors, from forest productivity to climate change threat on natural resources. Its aim, as with resource management itself, is to combine economics, policy, and science to help rehabilitate and preserve our natural resources. This book provides a comprehensive compilation of sustainable natural resource management, determinants of forest productivity, agriculture and climate change impact, water management and control of salinity, climate change threat on natural resources, and vulnerability due to climate change. I believe that this book serves as an opportunity for scientists who are internationally renowned in their fields, addressing issues and interests of academics and other stakeholders engaged in applied science.

I congratulate the editors, the contributors across the country, and the publisher for bringing out timely publication depicting climate impact on natural resource management and hope that this important book shall serve as a reference for different institutions working in this area.

*Dr. Arvind Kumar  
Vice-Chancellor*

*Rani Lakshmi Bai Central Agricultural University  
Gwalior Road, Jhansi 284003 (UP) India*

## Preface

Climate change is one of the major global concerns in today's world. Assessment of the relationship between natural resources and climatic drivers along with the assessment of probable impacts of climate change on natural resources is essentially required to develop mitigation and adaptation strategies. Statistics show that the average surface temperature of planet Earth has increased by about 1.18 °C since the late nineteenth century. Apart from this, the sea level has also increased by about 8 inches since the last century. Any further increase in the global temperature and sea-level rise would have a significant negative impact on the majority of natural resources and human well-being. Global climate change that is mostly driven by human-induced activities needs to be understood clearly so that strategies can be planned for an early action before it is too late. Thus it is quite evident that we need to be serious when dealing with the consequences of climate change. Updated and timely information on the changing flux of solar radiation, atmospheric warming, patterns and variations in precipitation, trends of increasing CO<sub>2</sub> concentration, etc. are essential to keep track of changing climate. The pathways that are linked to climate change such as different socio-economic activities, burning of fossil fuels, land-use change, forest cover change dynamics, health estimates of agriculture and forested lands, the productivity of agriculture and forestry systems, etc. provide essential insight to develop a sustainable plan for the management of natural resources.

The IPCC announced that the increase in the recorded Earth's temperature during the last 50 years is the result of various human activities. Climate change has become an important driving force in regulating mechanisms of the physical and biological world. It is now well established that climate change influences a vast number of sectors and resources, either directly or indirectly. The governments of the world have responded to the threats associated with climate change to formulate actions for mitigation. For a better understanding, long-term observation is desirable to continuously monitor precipitation, temperature, daily radiation, etc. along with the monitoring of the spatial extent and health of natural resources to conclusively establish site-specific impact assessment. Throughout the world, several attempts have been made to minimize the impact of climate change or to initiate necessary steps to retard the speed of climate change. Natural resources not only contribute to the overall growth of the economy of a nation but also reduces poverty when adequate management and sustainability are ensured. Natural resource management has emerged as one of the most inclusive growth sectors for supporting the economy of Asian countries. Besides, the forward and backward linkages of natural resources to climate

change require a comprehensive understanding of a sustainable world. Global weather and climate studies are increasingly being considered as a vital source of information to understand the Earth's environment, especially human-induced climate studies and factors affecting natural resources.

This book covers significant and updated contributions in the field of sustainable natural resources management linked to climate change. The updated knowledge from countries like India, Indonesia, Japan, Malaysia, Sri Lanka, and the USA is presented in this book through selected case studies for major thematic areas that have basic preliminary concepts and elaborates the scientific understanding of the relationship between natural resources and climatic drivers, influence of climate change on agriculture, forest, water resources, etc. The book has been separated into six major themes, each having subject-specific chapters to develop the concept and to present the findings in a lucid way that is useful for a wide range of readers. While the range of applications and innovative techniques is constantly increasing, this book provides a summary of key case studies to provide the most updated information. Chapters incorporate multi-source data and information that offer critical understanding to explain the causes and effects of environmental changes linked to natural resource management. This book will be of interest to researchers and practitioners in the field of environmental sciences, remote sensing, geographical information, meteorology, sociology and policy studies, etc. related to natural resource management and climate change. Also, scientists and graduate and post-graduate level students of various disciplines will find valuable information in this book. We believe that the book would be read by people with a common interest in sustainable development and other diverse backgrounds within earth observation.

The scientific quality of the book was ensured by a rigorous review process where leading researchers from Australia, Canada, India, Indonesia, Japan, Malaysia, Sri Lanka, and the USA participated to provide constructive comments to improve the chapters. Due to the confidentiality of the review process, we are unable to provide their names; however, we are deeply indebted and thankful for their voluntary support. On behalf of the team of authors, we express our gratitude to the entire crew of Wiley for all kind of assistance to make this a successful endeavor.

### 1.1 Introduction

#### 1.1.1 Tropical Deforestation

Initially, carbon was stored in the forests (Houghton 2012), but once the forests were logged and cleared, carbon (i.e. both above and below ground) was released into the atmosphere (Baccini et al. 2012) mostly in the form of carbon dioxide (CO<sub>2</sub>). However, the decomposition or burning of the forest may also release small amounts of methane (CH<sub>4</sub>) and carbon monoxide (CO) (Achard et al. 2014; Rosa et al. 2016; Bebbler and Butt 2017; Brinck et al. 2017; Pearson et al. 2017). Thus deforestation received high attention from the scientific community (Rosa et al. 2016; Sierra et al. 2012; Zarin 2012) on carbon emissions (Numata et al. 2011; Houghton 2012; Le Quéré et al. 2015), especially in the tropics, where deforestation is responsible for 17%–25% of carbon dioxide (CO<sub>2</sub>) emissions into the atmosphere (Le Quéré et al. 2015). So tropical deforestation is one of the leading causes of global carbon emissions and biodiversity loss (Brun et al. 2015). Therefore, understanding its drivers is crucial for improving policies and measuring current forest trends toward a more climate- and biodiversity-friendly outcome (Hosonuma et al. 2012). Also, the Forest Resources Assessment (FRA) of the Food and Agriculture Organization of the United Nations (FAO) provides a complete measurement of above-ground carbon stocks for tropical forests (FAO 2006, 2010, 2015).

#### 1.1.2 REDD+

Reducing emissions from deforestation and forest degradation (REDD+) now constitutes the international convention for mitigating climate change, particularly in forest-rich developing countries (Gullison et al. 2007; Arima et al. 2014). The “+” after REDD

comes from more recent dialogs that have broadened the mechanism's scope to recognize carbon benefits of forest conservation, sustainable forest management (SFM), and the sequestration potential of afforestation and reforestation (Venter and Koh 2012). The REDD+ mechanism is the most prominent of recent attempts to mitigate climate change (Agrawal et al. 2011). Furthermore, leakage policies of REDD+ should be monitored, measured, and mitigated to guarantee their effectiveness (Atmadja and Verchot 2012).

Reducing emissions from deforestation by 2020 could bring the international community nearer to the goal of less than 2 degree increase in global average temperature change (Zarin et al. 2016). Furthermore, more than 180 governments, private companies, indigenous peoples, and non-governmental organizations have signed the New York Declaration on Forests (NYDF) in September 2014 (UN Climate Summit 2014). Within the REDD+ policy framework, developing countries might develop national systems for carbon accounting (Angelsen 2009; Logan-Hines et al. 2012).

Developing countries are encouraged to develop national strategies and action plans for REDD+ by identifying the drivers of deforestation (Hosonuma et al. 2012). In the past three decades, satellite-based observations of forest cover change provide an alternative to estimate deforestation rates regularly across space and time (Zhuravleva et al. 2013; Kuenzer et al. 2014; Kamaruddin et al. 2015). At continental to global scales, forest cover maps and change in cover are increasingly being generated from various satellite data sources (Potapov et al. 2012; Kim et al. 2014; Margono et al. 2014). In the latest development, Landsat images have been used to determine tropical deforestation rates (Broich et al. 2011; FAO 2011; Lehmann et al. 2014; Estavillo et al. 2013; Zhuravleva et al. 2013; Potapov et al. 2012). Also, previous studies of forest cover change datasets have been integrated with satellite-based forest biomass information to quantify changes in forest carbon stocks (Baccini et al. 2012; Achard et al. 2014; Tyukavina et al. 2015). However, they might show diverse results due to their different methods for mapping and analyzing.

### **1.1.3 REDD+ in Indonesia**

At the COP 15–2009 of the United Nations Framework Convention on Climate Change (UNFCCC), Indonesia voluntarily agreed to reduce emissions by 26% and up to 41% with international support by 2020. This commitment was submitted as Indonesia's Nationally Appropriate Mitigation Actions (NAMA) in 2010 (Indonesia 2013). Since the commitment, Indonesia made some policies, including Presidential Regulation No. 61 of 2011 (Indonesia 2011b) on the national action plan of REDD+ and Presidential Regulation No. 71 of 2011 on the implementation of the National GHG inventory (Indonesia 2011c). Those regulations mandate different government bodies to provide national, local, and corporate GHG inventories annually. Based on its nationally determined contribution (NDC) submitted to the UNFCCC on September 24, 2015 (Indonesia 2016), Indonesia committed to reducing GHG emissions by 29% under BAU (business as usual) scenario by 2030 unconditionally, and up to 41% conditionally. To meet the objective, Indonesia recognizes the requirement for consolidating both methods and data sources to guarantee a high degree of precision.
