COOLTURA

Climate change and the energy matrix

The climate change narrative is presented as “evidence”, even when a great part of the scientific community doesn’t agree with the alleged certainty that carbon dioxide produced by human activity causes increases in temperatures. But international organizations such as the UN, the IPCC that depends on it (Intergovernmental Panel on Climate Change), international agreements such as that of Paris (2015), organizations such as the World Economic Forum and of course the most influential billionaires such as Bill Gates and Elon Musk, all of them line up behind the climate change narrative and claim that it is necessary to change the energy paradigm, reduce carbon dioxide emissions and remove carbon dioxide from the atmosphere.

In this context, something known as “geoengineering” has flourished: a scientific-technical approach to developing strategies for mitigating climate change or manipulating the climate. Almost all of them include plans that should be implemented on a global scale to be successful. Geoengineering projects under development include different proposals: release tons of sulfur dioxide into the atmosphere to mitigate the impact of the sun, transform carbon dioxide into mineral and bury it or alter ocean currents, among many others. All of these “solutions” are as drastic as they are dangerous, and many warn that they could make the environmental situation even worse.
