Environment and Society

A Critical Introduction

Third Edition

WILEY Blackwell

Critical Introductions to Geography

Critical Introductions to Geography is a series of textbooks for undergraduate courses covering the key geographical sub-disciplines and providing broad and introductory treatment with a critical edge. They are designed for the North American and international market and take a lively and engaging approach with a distinct geographical voice that distinguishes them from more traditional and outdated texts.

Prospective authors interested in the series should contact the series editor:

John Paul Jones III

School of Geography and Development

1 Introduction: The View from a Human-Made Wild

[What is This Book?](#)

[The Authors' Points of View](#)

Part I Approaches and Perspectives

2 Population and Scarcity

[A Booming China or a Busting One?](#)

[The Problem of Exponential Growth](#)

[Population, Development, and Environment Impact](#)

[The Other Side of the Coin: Population and Innovation](#)

[Limits to Population: An Effect Rather than a Cause?](#)

[Thinking with Population](#)

3 Markets and Commodities

[The Bet](#)

[Managing Environmental Bads: The Coase Theorem](#)

[Market Failure](#)

[Market-Based Solutions to Environmental Problems](#)

[Beyond Market Failure: Gaps between Nature and Economy](#)

[Thinking with Markets](#)

4 Institutions and “The Commons”

[Controlling Carbon?](#)

[The Prisoner’s Dilemma](#)

[The Tragedy of the Commons](#)

[The Evidence and Logic of Collective Action](#)

[Crafting Sustainable Environmental Institutions](#)

[Are All Commoners Equal? Does Scale Matter?](#)

[Thinking with Institutions](#)

5 Environmental Ethics

[The Price of Cheap Meat](#)

[Improving Nature: From Biblical Tradition to John Locke](#)

[Gifford Pinchot vs. John Muir in Yosemite, California](#)

[Aldo Leopold and “The Land Ethic”](#)

[Liberation for Animals!](#)

[CAFOs and Climate Change: Now that You Know, What Should You Do?](#)

[Holism and Other Pitfalls](#)

[Thinking with Ethics](#)

6 Risks and Technology

[The Bt Cotton Revolution](#)

[Environments as Hazard](#)

[The Problem of Risk Perception](#)

[Risk as Culture](#)

[Beyond Risk: The Political Economy of Hazards](#)

[Thinking with Risk and Technology](#)

7 Political Economy

[The Contradictions of COVID-19](#)

[Labor, Accumulation, and Crisis](#)

[Production of Nature](#)

[Global Capitalism and the Ecology of Uneven Development](#)

[Social Reproduction and Nature](#)

[Environments and Economism](#)

[Thinking with Political Economy](#)

8 Social Construction of Nature

[The Blank Spot on the Map](#)

[So You Say It's "Natural?"](#)

[Environmental Discourse](#)

[The Limits of Constructivism: Science, Relativism, Thinking with Construction](#)

9 Feminism and the Environment

[Gender and Environment](#)

[Feminist Approaches to Economies and Nature](#)

[Feminist Approaches to Knowledge and the Environment](#)

[Thinking with Feminism and the Environment](#)

10 Racialized Environments

[Structural Environmental Racism](#)

[Environmental Justice](#)

[Settler Colonialism](#)

[Whiteness and Nature](#)

[Thinking with Racialized Environments](#)

Part II Objects of Concern

11 Carbon Dioxide

[Stuck in Pittsburgh Traffic](#)

[A Short History of CO2](#)

[Institutions: Climate Free-Riders and Carbon Cooperation](#)

[Markets: Trading More Gases, Buying Less Carbon](#)

[Political Economy: Who Killed the Atmosphere?](#)

[The Carbon Puzzle](#)

12 Trees

[Chained to a Tree in Berkeley, California](#)

[A Short History of Trees](#)

[Population and Markets: The Forest Transition Theory](#)

[Political Economy: Accumulation and Deforestation](#)

[Gender, Trees, and Power: Feminist Insights into Forests](#)

[Ethics, Justice, and Equity: Should Trees Have Standing?](#)

[The Tree Puzzle](#)

13 Wolves

[Wolves, Be Wary Where You Tread](#)

[A Short History of Wolves](#)

[Ethics: Rewilding and Wolves](#)

[Institutions: Stakeholder Management](#)

[Feminism: Of Wolves and Masculinity](#)

[The Wolf Puzzle](#)

14 Uranium

[Promise and Peril in Post-Nuclear Worlds](#)

[A Short History of Uranium](#)

[Risk and Hazards: Debating the Fate of High-Level Radioactive Waste](#)

[Race: Environmental Justice and the Navajo Nation](#)

[Social Construction: Discourses at Work in Australia](#)

[The Uranium Puzzle](#)

15 Tuna

[Big Trouble for Big Tuna](#)

[A Short History of Tuna](#)

[Markets and Commodities: Eco-Labels to the Rescue?](#)

[Political Economy: Re-regulating Fishery Economies](#)

[Ethics: Saving Animals, Conserving Species](#)

[The Tuna Puzzle](#)

16 Lawns

[How Much Do People Love Lawns?](#)

[A Short History of Lawns](#)

[Risk and Chemical Decision-Making](#)

[Social Construction: Good Lawns Mean Good People](#)

[Political Economy: The Chemical Tail Wags the Turfgrass Dog](#)

[The Lawn Puzzle](#)

17 Bottled Water

[A Tale of Two Bottles](#)

[A Short History of Bottled Water](#)

[Population: Bottling for Scarcity?](#)

[Risk and Technology: Health and Safety in a Bottle?](#)

[Political Economy: Manufacturing Demand on an Enclosed Commons](#)

[Racialized Environments: The Burden of Bottled Water in the United States](#)

[The Bottled Water Puzzle](#)

18 French Fries

[Getting Your French Fry Fix](#)

[A Short History of the Fry](#)

[Feminist Approaches: The Body Politics of French Fries](#)

[Political Economy and Racialized Environments: Have it Your Way?](#)

[Ethics: Protecting or Engineering Potato Heritage?](#)

[The French Fry Puzzle](#)

19 E-Waste

[Digital Divides](#)

[A Short History of E-Waste](#)

[E-Waste and Markets: From Externality to Commodity](#)

[The Political Economy of E-Waste](#)

[E-Waste and Racialized Environments](#)

[The E-Waste Puzzle](#)

List of Figures

1.1 Sandhill cranes of the Platte River. A half million of these birds congregate annually.

1.2 Heck Cattle, introduced to replace the extinct Aurochs.

2.1 Hypothesized demographic trends in a Malthusian conception. Limits of the environment, though they are amenable to steady increases resulting from growths in resource production, control human population trends with periods of high growth followed by periodic calamities and corrections that bring population back in line with the environment.

2.2 World population since 1750. Rapid increases in recent decades reflect exponential growth.

2.3 Global population growth rates. Population growth rates peaked in the 1960s and have steadily and continuously declined since then.

2.4 Population growth rates worldwide by country.

2.5 The demographic transition model. In theory, falling death rates lead to population growth, but as birth rates fall thereafter, the rate of growth slows, eventually ceasing when the two reach equilibrium.

2.6 National fertility and female literacy rates around the world: 2006. As female literacy increases, and along with it women's autonomy and employment, fertility rates fall to replacement levels.

3.1 Environmental scarcity drives markets. Shell gas station operator Steve Grossi's gasoline price board at his Shell station in Huntington Beach.

3.2 The market response model. In theory, scarcity of environmental goods and services sets into motion a series of adaptations to rising prices, actually resulting in increasing resource availability.

3.3 Regulation versus cap and trade. Both approaches result in net desired pollution reduction, but the cap-and-trade approach is theoretically cheaper overall.

4.1 The Prisoner's Dilemma in game-theoretical terms. The best outcome, in the upper left, is also the least likely, since each player prefers to avoid the worst individual outcomes, in the upper right and lower left corners, leading to the worst collective outcome, in the lower right.

4.2 Irrigation systems are labyrinths of sluices, canals, and gates, which test the limits of people's ability to cooperate in managing environmental goods. This example, from the village of Musha in the Nile Valley, shows the interrelationships of one private field to the next, tied together by the mutual need for water held communally.

4.3 A woman tending her herd in India. In many parts of the world the responsibility for using common property and the control over the rules of the commons are often split along lines of gender, class, or race, portending problems for management.

5.1 A sow's "farrowing crate," where she will remain for the 35 (or so) days her young are nursing. Crating is an economically efficient method of raising hogs, but is it wrong?.

5.2 (a + b) Hetch Hetchy Valley, undammed before 1914 (left), and today (right), now dammed to provide the city of San Francisco with a clean and reliable source of fresh water. The fate of this valley was debated between leaving it "wild" versus appropriating it for its direct human usefulness.

6.1 Voluntary/Involuntary-Common/Catastrophic: A matrix for explaining what people think is risky and why. Each axis describes the characteristic of a hazard that tends to lead people, however erroneously, to assume it is or is not risky.

6.2 Map of tribal lands and superfund sites.

7.1 The secret of surplus value, in a nutshell. By the same principle, the environment must be worked harder and underinvested in order to sustain surpluses. The artist, Fred Wright (1907-1984), made panel-cartoons and animated shorts for the United Electrical Workers Union throughout his career.

7.2 Schematic representation of the possible contradictions that capitalism produces and the social and environmental responses they engender, possibly leading the way to a more sustainable and transparent society.

8.1 Though Pacific Northwest forest is “Old Growth,” since many of its trees are more than 150 years old, many of these forests are quite young, have been highly disturbed, swept by fire, and impacted by human uses. In this sense, not all Old Growth Forest is “pristine”.

8.2 Pollen evidence from Morocco over 14,000 years. Despite the ongoing dominant discourse that post-Roman North Africa experienced “desertification” and loss of tree cover following “Arab Invasions,” pollen data show no significant decrease in tree pollen in the past thousand years.¹²⁶

8.3 John Gast, “American Progress,” 1872. Lady Liberty brings light (and farmers, plowed fields, telegraph lines, trains, etc.) as she drives the darkness (including “Indians” and wild animals) out of the wilderness.

9.1 Percentage female interns, staff, and boards of all mainstream environmental organizations (adapted from

Taylor 2014).

9.2 The diverse economies iceberg, featured on the website of the Community Economies Collective and the Community Economies Research Network.

9.3 An industrial worker with Phossy Jaw.

9.4 BabyLegs (below) compared to a more traditional trawling micro-plastics sensor. BabyLegs is usually made from pink baby tights that bob in the water, making it look like she is swimming.

10.1 Predicted surface of child blood lead level and ward-specific elevated water lead level after (post) water source change from Detroit-Supplied Lake Huron water to the Flint River: Flint, MI,

10.2 Correlations of class and race with plumbing poverty in the United States. Native communities in the West are especially impacted.

10.3 Hazardous waste and military facilities in Tooele County.

11.1 Carbon on Earth. A Gt is a gigaton, or a billion tons. Ninety-nine percent of carbon is contained in the Earth's crust. Most of the flow of carbon is between the oceans, the atmosphere, and soils and plants. Modern industry has removed large quantities of carbon from the Earth's crust and, through combustion, has released them into the atmosphere as CO₂.

11.2 The Keeling curve: Atmospheric concentrations of CO₂ since 1958. The overall trend is a steady upwards curve. Annual variability (smaller up and down oscillations) is a result of the seasons in the northern hemisphere; plants green up in the spring, taking CO₂ out of the atmosphere, and die-off in the fall, re-releasing that carbon.

11.3 Atmospheric concentration of carbon. Over the past thousand years carbon in the atmosphere has hovered at around 280 parts per million. With the explosion of industrial activity starting in 1800, more parts of human activity depend on combustion of fossil fuels and atmospheric carbon has increased exponentially as a result.

11.4 Global average temperatures, sea level, and snow cover. Over precisely the period when there has been a radical increase in the emission by people of gases that are understood to trap heat in the atmosphere, global temperatures have risen steadily, sea levels have increased, and snow cover has declined.

11.5 Cartogram of carbon emissions. In this map, countries are shown with their apparent size proportional to their total annual emissions in

11.6 The strange logic of carbon offsets.

12.1 Sequoia sempervirens, the genus in the cypress family Cupressaceae. Sequoia National Park, California. Trees are some of the largest and longest-lived organisms around which human beings live. Their influence on human culture has been enormous.

12.2 Global deforestation rates.

12.3 Forest cover in France from 1500 to 2000. The pattern of decline and regrowth follows a notably “U-shaped” curve, which has been a key argument in favor of the so-called forest transition theory.

13.1 The gray wolf.

13.2 World map of countries with known gray wolf populations in

13.3 Estimated range of gray wolves in the contiguous United States.

13.4 Wolf management zones in Minnesota.

13.5 An early twentieth-century government wolf trapper.

14.1 The nuclear fuel chain.

14.2 World uranium production,

14.3 Colonial division of labor in the Navajo uranium mines. Denny Viles (third from left), executive with the Vanadium Corporation of America, in shirt, tie, and soft-sided hat; the other three men in the picture are hard-hatted Navajo mineworkers.

14.4 The Ranger Uranium mine and mill, Northern Territory, Australia.

15.1 The sleek, powerful, bluefin tuna. The bluefin are the largest of the tuna (the largest one ever caught weighed 1496 pounds).

15.2 Dolphin mortality at the hands of US fishing vessels using purse-seine tuna technology in the Eastern Tropical Pacific, 1960-

15.3 The “Medina panel,” one of a few technological and operational changes made by purse-seine tuna fishers in attempts to reduce dolphin mortality.

15.4 A label from a can of Alaska salmon bearing the Marine Stewardship Council stamp of approval. (MSC label blown up to show detail).

15.5 Does a tuna have rights? Mutilated tuna rest on pallets at a seafood wholesaler in Tokyo. The image accompanied a “treehugger.com” article about overfished tuna stocks. No mention was made of the tunas’ rights or their dignity being violated, either before or after catch.

16.1 Lead arsenate - most popular pesticide prior to DDT.

16.2 Map showing quantity of turfgrass across the United States.

16.3 The lawn chemical commodity and knowledge chain.

17.1 The Poland Spring “Spring House” in 1910. Like other naturally occurring springs, these water sources had become elite destinations in the 1800s. Markets for their waters were associated with luxury, health, and opulence. They were not a typical household expense, however, for working people who were only then beginning to receive regular water delivery through modern plumbing.300

17.2 Women draw water from a communal well in Rajasthan, India. Though groundwater declines threaten these rural water supplies, villagers depend on freely available communal water sources for survival, and upon the significant women’s labor require to draw, carry, and dispense water every day.

17.3 US per capita consumption of bottled water from 1988 to 2007. The steady increase in US bottled water consumption shows no signs of abatement. Consumption has quadrupled in the past 20 years.

17.4 Cartogram of bottled water consumption worldwide.

17.5 Median amount spent each month by US survey respondents on bottled water, per household.

17.6 Percentage of US survey respondents who think bottled water is safer than tap water.

18.1 Transfer and spread of the potato after the Columbian Exchange.

19.1 In Agbogbloshie, Accra, Ghana.

19.2 Life-cycle flow chart for electronic products.

19.3 Global trade in e-waste,

19.4 Battery Imports to the United States from Canada and Mexico for 2011.

List of Tables

2.1 Who is overpopulated? Some comparisons of population, per capita gross domestic product, energy use, and other resource demands. Different places have widely divergent levels of population, affluence, and technology, with unclear implications for environmental impact.

3.1 Market-based solutions. An overview of some dominant environmental regulatory mechanisms that involve market components and are based in part on market logics. Note that in all cases the state remains an important player in making markets work and achieving environmental goals.

12.1 Comparison of the number of important insect species measured to be present in differing systems of coffee production in Costa Rica

12.2 Some key tropical exports and their leading export countries. Most major tropical commodities are grown in forest frontiers of countries experiencing tropical deforestation.

12.3 The predominant banana export companies operating globally, their share of the market in 2002, and their headquartered locations.

13.1 Countries worldwide with gray wolf populations of 3000 or greater.

14.1 Countries producing most uranium, 2019.

14.2 Comparison of predicted and actual radioactive contaminant migration at Maxey flat low-level radioactive waste facility, Kentucky (US).

15.1 Overfished marine species.

17.1 Freshwater usage around the world. The total average withdrawals of freshwater per person vary enormously around the world, as do the proportions of those dedicated to domestic use.

17.2 Domestic US water use. A family of four uses 400 gallons of water daily, 300 of which are used indoors

17.3 Selected leading per capita consumer nations of bottled water, 2007.

18.1 Energy inputs and costs of potato production per hectare in the United States.
