Published

How Cities Learn: Tracing Bus Rapid Transit in South Africa
Astrid Wood

Defensible Space on the Move: Mobilisation in English Housing Policy and Practice
Loretta Lees and Eleanor Warwick

Geomorphology and the Carbon Cycle
Martin Evans

The Unsettling Outdoors: Environmental Estrangement in Everyday Life
Russell Hitchings

Respatialising Finance: Power, Politics and Offshore Renminbi Market Making in London
Sarah Hall

Bodies, Affects, Politics: The Clash of Bodily Regimes
Steve Pile

Home SOS: Gender, Violence, and Survival in Crisis Ordinary Cambodia
Katherine Brickell

Geographies of Anticolonialism: Political Networks Across and Beyond South India, c. 1900-1930
Andrew Davies

Geopolitics and the Event: Rethinking Britain's Iraq War through Art
Alan Ingram

On Shifting Foundations: State Rescaling, Policy Experimentation And Economic Restructuring In Post-1949 China
Kean Fan Lim

Global Asian City: Migration, Desire and the Politics of Encounter in 21st Century Seoul
Francis L. Collins

Transnational Geographies Of The Heart: Intimate Subjectivities In A Globalizing City
Katie Walsh

Cryptic Concrete: A Subterranean Journey Into Cold War Germany
Ian Klinke

Work-Life Advantage: Sustaining Regional Learning and Innovation
Al James

Pathological Lives: Disease, Space and Biopolitics
Steve Hinchliffe, Nick Bingham, John Allen and Simon Carter

Smoking Geographies: Space, Place and Tobacco
Ross Barnett, Graham Moon, Jamie Pearce, Lee Thompson and Liz Twigg

Rehearsing the State: The Political Practices of the Tibetan Government-in-Exile
Fiona McConnell

Nothing Personal? Geographies of Governing and Activism in the British Asylum System
Nick Gill

Articulations of Capital: Global Production Networks and Regional Transformations
John Pickles and Adrian Smith, with Robert Begg, Milan Buček, Poli Roukova and Rudolf Pástor

Metropolitan Preoccupations: The Spatial Politics of Squatting in Berlin
Alexander Vasudevan

Everyday Peace? Politics, Citizenship and Muslim Lives in India
Philippa Williams

Assembling Export Markets: The Making and Unmaking of Global Food Connections in West Africa
Stefan Ouma

Africa's Information Revolution: Technical Regimes and Production Networks in South Africa and Tanzania
James T. Murphy and Pádraig Carmody

Origination: The Geographies of Brands and Branding
Andy Pike

In the Nature of Landscape: Cultural Geography on the Norfolk Broads
David Matless

Geopolitics and Expertise: Knowledge and Authority in European Diplomacy
Merje Kuus

Everyday Moral Economies: Food, Politics and Scale in Cuba
Marisa Wilson

Material Politics: Disputes Along the Pipeline
Andrew Barry

Fashioning Globalisation: New Zealand Design, Working Women and the Cultural Economy
Maureen Molloy and Wendy Larnar

Working Lives - Gender, Migration and Employment in Britain, 1945-2007
Linda McDowell

Dunes: Dynamics, Morphology and Geological History
Andrew Warren

Spatial Politics: Essays for Doreen Massey
Edited by David Featherstone and Joe Painter

The Improvised State: Sovereignty, Performance and Agency in Dayton Bosnia
Alex Jeffrey

Learning the City: Knowledge and Translocal Assemblage
Colin McFarlane

Globalizing Responsibility: The Political Rationalities of Ethical Consumption
Clive Barnett, Paul Cloke, Nick Clarke & Alice Malpass

Domesticating Neo-Liberalism: Spaces of Economic Practice and Social Reproduction in Post-Socialist Cities
Alison Stenning, Adrian Smith, Alena Rochovská and Dariusz Świątek

Swept Up Lives? Re-envisioning the Homeless City
Paul Cloke, Jon May and Sarah Johnsen

Aerial Life: Spaces, Mobilities, Affects
Peter Adey

Millionaire Migrants: Trans-Pacific Life Lines
David Ley

State, Science and the Skies: Governmentalities of the British Atmosphere
Mark Whitehead

Complex Locations: Women's geographical work in the UK 1850-1970
Avril Maddrell

Value Chain Struggles: Institutions and Governance in the Plantation Districts of South India
Jeff Neilson and Bill Pritchard

Queer Visibilities: Space, Identity and Interaction in Cape Town
Andrew Tucker

Arsenic Pollution: A Global Synthesis
Peter Ravenscroft, Hugh Brammer and Keith Richards

Resistance, Space and Political Identities: The Making of Counter-Global Networks
David Featherstone

Mental Health and Social Space: Towards Inclusionary Geographies?
Hester Parr

Climate and Society in Colonial Mexico: A Study in Vulnerability
Georgina H. Endfield

Geochemical Sediments and Landscapes
Edited by David J. Nash and Sue J. McLaren

Driving Spaces: A Cultural-Historical Geography of England's M1 Motorway
Peter Merriman

Badlands of the Republic: Space, Politics and Urban Policy
Mustafa Dikeç

Geomorphology of Upland Peat: Erosion, Form and Landscape Change
Martin Evans and Jeff Warburton

Spaces of Colonialism: Delhi's Urban Governmentalities
Stephen Legg

People/States/Territories
Rhys Jones

Publics and the City
Kurt Iveson

After the Three Italies: Wealth, Inequality and Industrial Change
Mick Dunford and Lidia Greco

Putting Workfare in Place
Peter Sunley, Ron Martin and Corinne Nativel

Domicile and Diaspora
Alison Blunt

Geographies and Moralities
Edited by Roger Lee and David M. Smith

Military Geographies
Rachel Woodward

A New Deal for Transport?
Edited by Iain Docherty and Jon Shaw

Geographies of British Modernity
Edited by David Gilbert, David Matless and Brian Short

Lost Geographies of Power
John Allen

Globalizing South China
Carolyn L. Cartier

Geomorphological Processes and Landscape Change: Britain in the Last 1000 Years
Edited by David L. Higgitt and E. Mark Lee

Series Editors' Preface

The RGS-IBG Book Series only publishes work of the highest international standing. Its emphasis is on distinctive new developments in human and physical geography, although it is also open to contributions from cognate disciplines whose interests overlap with those of geographers. The series places strong emphasis on theoretically informed and empirically strong texts. Reflecting the vibrant and diverse theoretical and empirical agendas that characterize the contemporary discipline, contributions are expected to inform, challenge and stimulate the reader. Overall, the RGS-IBG Book Series seeks to promote scholarly publications that leave an intellectual mark and change the way readers think about particular issues, methods or theories.

For details on how to submit a proposal please visit:

Acknowledgements

This book is the outcome of more than a decade of research and it would be impossible to thank all those whose support has buoyed it.

To my interviewees in South Africa and those who gave me so many hours of their time, I hope this work provides support to continue improving urban life. This book captures and shares the story of BRT in South Africa, and provides a vital record of post-apartheid transformation. Many of the key figures named in this book have since left government, retired or otherwise moved on to new positions, taking their institutional memory with them. They risked their careers and their lives for a more equitable South Africa. Thank you for your bravery, dedication and candor.

I am indebted to my mentors at Newcastle University and UCL as well as Cardiff University, Royal Holloway University of London and London School of Economics for their feedback and encouragement. I am eternally grateful to Jenny Robinson and Andrew Harris whose insightful comments provided the roadmap throughout my learning process.

I am thankful to my friends and colleagues in Newcastle, London, Cape Town, Johannesburg, and around the world who offered feedback on journal articles, book chapters, conference presentations and grant proposals, as well as direction for how to navigate the academic netherworld.

A special thanks to the series editors Ruth Craggs, David Featherstone and Chih Yuan Woon for their careful engagement with the manuscript.

I am lucky to have an encouraging husband whose love is my firmest support, children who brighten even the cloudiest of days, and a family that keeps me grounded throughout the many travels we take as academics and individuals.

This book captures and shares the story of BRT in South Africa, and provides a vital record of post-apartheid transformation. Many of the key figures named in this book have since left government, retired or otherwise moved on to new

positions, taking their institutional memory with them. They risked their careers and their lives for a more equitable South Africa. Thank you for your bravery, dedication and candor.

I dedicate this work to my late father whose pursuit of social justice imbued me with a similar sense. His anti-apartheid activism, along with so many others, helped make the country of my birth a better place.

This book is for all those who believe.

Chapter One

Introduction

BRT Arrives in South Africa

From Curitiba and Bogotá to Ahmedabad and Beijing, bus rapid transit (BRT) has promised to be a quick, cost-effective and efficient method of urban transportation that combines the speed and quality of rail transportation with the flexibility of a bus system. BRT is a rubber-tired mode of urban public transportation that combines buses, busways and stations with intelligent transportation systems, operational and financial plans, integrated ticketing, and a branded identity. It has been a dominant feature of urban planning for decades in cities as diverse as Bogotá, Curitiba, Guangzhou, Lima, Los Angeles, Mumbai, and New York, among others. Whereas previous studies have considered the characteristics of BRT (Deng and Nelson 2011; Jarzab et al. 2002; Levinson et al. 2003) or its impact on transportation planning (Ferbrache 2019; Paget-Seekins and Munoz 2016), this book is the first attempt to understand the global proliferation of BRT.

Much of its current popularity is due to the vehement promotion undertaken by Enrique Penalosa, Bogotá's Mayor from 1998 to 2001 and again from 2016 to 2019, and his ties with the Institute for Transportation and Development Policy (ITDP) (Wood 2014b, 2019b). More than two decades since Bogotá's Transmilenio opened to global acclaim, BRT has become one of the most prominent policy solutions of the 21st century. Around the world, Transmilenio-style systems are commended by BRT advocates for improving mobility, by reducing travel time and improving comfort and reliability; and its transformation into best practice is often attributed to its affordability, brief implementation phase and gener-

ous political payoffs. It is presented as a best practice appropriate within a variety of geographical and socio-political settings, and able to tackle problems related to economic exclusion and inequality, urban sprawl and sustainability, and transportation inaccessibility.

The Bogotá model of BRT first arrived in South Africa in July 2006 at a special session of the Southern African Transport Conference (SATC), the largest transportation convention in the region and a critical platform for dialogue on issues ranging from finance to public transportation. Lloyd Wright, a global expert on BRT, was invited by the National Department of Transport to host a day-long workshop on the principles, attributes and engineering specifications of BRT. This learning was reinforced in August 2006 when Lloyd Wright visited politicians and transportation planners in Cape Town, eThekweni, Johannesburg and Tshwane to present the attributes of BRT. Interested cities then took a select group of politicians, planners, operators and consultants to Bogotá to see how BRT operates and meet with transportation operators. Policymakers returned from these study tours eager to introduce BRT locally.

Since 2006, BRT has been adopted in six South African cities to improve transportation services, especially for the urban poor. Cape Town, eThekweni, Johannesburg, Nelson Mandela Bay, Rustenburg, and Tshwane are currently in various stages of planning and implementation: in August 2009, just three years after learning of the Bogotá model of BRT, Rea Vaya Phase 1A opened in Johannesburg as the first full-feature BRT system in an African context; in May 2011, Cape Town's MyCiTi Phase 1A became operational; in May 2012, eThekweni Council approved plans to proceed with the first three lines of Go Durban!; and in July 2012, the cascade continued with Rustenburg and Tshwane beginning construction on Yarona and A Re Yeng. Not all cities have had a simple, straightforward experience, however: since 2008, Nelson Mandela Bay's attempt to introduce BRT has been stalled by municipal politics and poor planning, and in spite of considerable efforts, the project remains in a state of postponement.

While the South African systems are unmistakably modeled after the achievements of those in Bogotá, the process through which South African officials learned of, and implemented BRT, remains unexplored. In mapping the learning process, this book considers how and why city leaders adopt circulated best practice.

Understanding the South African City

The adoption of BRT in South Africa reflects the historical spatial planning of apartheid (Christopher 1995; Parnell 1997; Parnell and Mabin 1995; Robinson 1996, 1997) and the challenges facing post-apartheid policies to remedy these dysfunctional schemes (Haferburg and Huchzermeyer 2014; Harrison et al. 2008, 2014; Parnell and Pieterse 2014). South African cities were shaped primarily

by policies of strict racial segregation but also rigorous separation of economic and residential zones, which denied Black residents full access to the city and its economic base (Davies 1981; Home 1990; Lemon 1991; Western 1985); and had the secondary objective of increasing travel times considerably for non-White residents (Pirie 2013, 2014). Apartheid settlement strategies located townships on the periphery of cities and heavily subsidized public transportation to enable workers to travel long distances at low fares (Beall et al. 2002; Turok and Watson 2001). Under the old regime, only those with passes were permitted to travel between the townships and the city, and thus movement was generally only permitted on weekdays between home and work. Because of the inheritance of these restrictions, to this day there is effectively no pattern of non-work travel between the suburban areas and the city center. The introduction of BRT is an attempt to unsettle these socio-spatial settlement patterns.

Today, South African cities are characterized by contrasts and dualisms: high-rise residential towers turned slums; Victorian houses surrounded by privatized greenery; endless stretches of banal suburban development punctured by low-cost government-sponsored housing; European cafés and upmarket shops with hawkers selling homemade wares and promising to guard the luxury cars. The one commonality across the fragmented post-apartheid landscape is the proliferation of the automobile – its presence dominates the physical landscape of the city as well as the cultural milieu. Obviously, the South African city is not unique in this feature, but the degree to which apartheid's forced segregation stretched the city amplifies this condition. Although this understanding of the spatial character of the South African city as uneven is generally applied ubiquitously, there are profound differences across South African cities reflecting their distinctive topography and resulting settlement patterns, as well as their sociocultural composition, economic vitality and historic planning and contemporary governance. My assessment of the spatial form and associated mobility dynamics sheds light on the complex and challenging advancement of inclusive South African cities.

South African history is riddled with transportation experiments: horse-drawn streetcars were introduced in the 1890s, electric trams operated until the Second World War and trolleybuses ran in the high-apartheid period until Johannesburg, the last city to do so, terminated services in 1986. There are a number of detailed empirical accounts of the trams and trolleybus systems in Cape Town (Gill 1961; Joyce 1981), eThekweni (Jackson 2003), Johannesburg (Sey 2012; Spit and Patton 1976) and Nelson Mandela Bay (Shields 1979), as well as analyses of the development of the road system (e.g. Rosen 1962 in Johannesburg) and the emergence of the minibus taxi industry (Khosa 1991, 1995; McCaul 1990). Because South African city form and function makes it difficult to support a sunken subway – Johannesburg is built atop a maze of underground gold mining shafts and Cape Town rests largely on marsh and infill – transportation officials and engineers have struggled to modernize the commuter rail and

municipal bus services. The commuter rail network is poorly maintained and its fixed lines prove inadequate in the expanding metropolises. Bus systems are similarly struggling to service the low-density urban form. The modernist aspiration of car ownership and its associations with independence and wealth is reinforced in practical terms through the dispersed city form, which separates people from economic and social opportunities.

For the most part, the urban populace relies on a politically powerful and largely under-regulated fleet of overcrowded, poorly maintained minibus taxis that operate irregular services. The minibus taxi industry has captured the majority of market share against subsidized modes, carrying about 60 percent of trips, nationally. The industry emerged in the 1980s in reaction to the failures of government to supply adequate bus and train services to the townships (Khosa 1991, 1995; McCaul 1990). In the sprawling landscape of contemporary urban South Africa, the minibus taxi is generally preferred to government-sponsored bus and rail services because it is considered more convenient in terms of routing and frequency (Clark and Crous 2002). While there are certainly arguments in support of the minibus taxi industry with proponents describing it as a self-made, Black entrepreneurial venture, in general commuters are dissatisfied with the slow, capricious quality of the informal services (Salazar Ferro et al. 2013). The South African policymakers I interviewed described an almost doomsday scenario filled with uncertainty, labeling it a “commuter crisis” akin to the global financial crisis and calling for fundamental reform to the transportation network.¹

As a result of these features, transportation planning has been understood as central to the transformation of South African cities. Transportation has historically been used to divide the spatial layout of cities. Planned roads have been used to separate planning typologies in both planned and unplanned settlements, and transportation systems have been used to control who can access the city and how they move. In South Africa, planners have been especially focused on building modernist highways to accommodate the White elite who could afford to drive. The fact that transportation is experienced by a range of people across incomes and experiences, means that it also serves as an arena for social mixing and these interactions have unbridled opportunities for change. Policymakers in South Africa have been attuned to these openings, and efforts to remedy the inequality of transportation have been at the forefront of urban planning and policymaking since 1994. Transportation has also been, and continues to be, a site of resistance. The success of the 1957 Alexandra bus boycotts in Johannesburg was a pivotal moment in the anti-apartheid movement; and in the post-apartheid era, transportation continues to be a point of contention in service delivery protests.

This book aims to explain how South African policymakers are trying to improve urban transportation, specifically addressing the process by which best practice is drawn from elsewhere to inform local planning and policy change. In South Africa, BRT is seen as the solution that simultaneously provides

transportation users with an affordable, reliable and safe transportation system, taxi operators with formalized and stable employment, and buses and rail operators with viable routes. Its larger purpose is to address the severe historical spatial divide along racial lines and post-apartheid splintered urbanism. The operational systems conjure up images of equality and dignity for all South Africans, moving freely and efficiently through urban space regardless of skin color or income, in a city free from the grip of informality, and instead managed by an efficient and capable municipal government. In this post-apartheid moment, transportation may be South Africa's best tool through which to bridge the divided city.

Transport Geography, Policy Mobilities and Learning in and from the South

City learning is hardly a new practice. Herodotus described information exchanges as early as 500 BCE; in the second century, Palmyra adapted Roman concepts of urbanity; and in the 1700s, Peter the Great employed Dutch architectural models in St. Petersburg (Healey 2013). In the early 20th century, cities shared their experiments with electricity, gas, sewerage and water services (Dogliani 2002; Gaspari 2002; Kozinska-Witt 2002; Saunier 2002; Vion 2002). These exchanges became a "precious resource" to subvert or strengthen local policy decisions (Saunier 2002: 519). These "transboundary connections" (Saunier 2002: 510) were often a method of "intergovernmental diplomacy" (Saunier 2002: 509), with scholars suggesting that these collaborations advanced urban development (Healey and Upton 2010; Saunier 2002; Saunier and Ewen 2008; Sutcliffe, 1981).

In the contemporary era, learning has become a regular and routine aspect of policy creation. Policymakers seek innovative lessons and models from elsewhere, assuming that "viewing a familiar problem in an unfamiliar setting expands ideas of what is possible, and can inspire fresh thinking about what to do at home" (Rose 1993: 30). Rose (1993) suggests that positive lessons provide insight for local policymakers, and negative lessons help them avoid others' mistakes. And Bennett (1991) confirms that when cities are confronted with local challenges, there is a natural tendency to look elsewhere for innovation. Learning, however, is deeply entangled with the politics of people and place, and it should be understood in terms of the cultural, economic, historical, and political connections and disconnections through which knowledge moves. Cities and their policymakers compete for prestige, and practices of exchange are rarely just about rationalist transfers of knowledge. Mobilized policy is often seen as "politically neutral truths", but beneath "this superficial impartiality" these lessons can serve as "political weapons" (Robertson 1991). Indeed, acts of knowledge sharing initiate particular policies and certain cities into conversations, while pushing others apart.

The South African city's propensity to apply foreign planning models is rooted in its history, where urban design and transportation innovations were imported from the colonial metropole. Colonialism created an atmosphere conducive to the temptation of imitation, in which the local environment lacked "genuine ties with the world surrounding them" (Mbembe 2004: 375), and instead linked itself to classical aspects of European cosmopolitanism. This is evident in architectural form: various technical and political interventions including "prefabricated iron-fronted shop buildings, barrel-vaulted arcades with prismatic glass skylights, cast-iron gas lamps, electric lighting, telephone wires..." (Chipkin 1993: 22), as well as horse-drawn trams and railroads. This "overseas cultural traffic" (Mbembe and Nuttall 2004: 362) flowed through colonial relationships with London, Paris and New York. During the emergence of professionalized planning, universities trained colonial planners in modernist techniques, later applied across the colonial world. In South Africa, town planners studied in London after the Second World War and, through these exchanges, developed what became classic apartheid planning mechanisms (Wood 2019a).

Today, the South African urban landscape is reflective of a global convergence of policy knowledge, and several ostensibly South African policies are also evidenced elsewhere: approaches to growth management, informal settlement upgrading, sustainability, and even securitization and gated communities (Bénit-Gbaffou et al. 2012; Morange et al. 2012) migrated from North America, Brazil and Europe, and were adopted in South African cities because of their success elsewhere; city improvement districts (elsewhere, business improvements districts) are located in precincts across Cape Town and Johannesburg, as well as in Amsterdam, London and New York (Didier et al. 2012; Morange et al. 2012; Peyroux et al. 2012) and city development strategies, in particular Johannesburg's 2040 Growth and Development Strategy, are considered best practice and duplicated globally (Robinson 2011). While the regularity by which South African cities learn of and implement policies from elsewhere is evident, the process of, and rationale for, learning and adoption demands further theoretical unpacking.

In South Africa, a desire to copy from urban experiences elsewhere is reinforced today through the language of south-south exchange, which suggests that localities across the global south may find better solutions by looking to one another rather than to their colonial metropole. Southern cities are presumed to share commonality with their postcolonial neighbors, and by exchanging their experiences and experiments, it is thought that they might develop more imaginative and effective solutions to remedy their urban challenges. This political argument has fueled the circulation of supposedly southern-generated best practices like BRT. Questions remain, however, regarding the extent to which this learning impacts development in southern cities, either by reinforcing former colonial ties through contemporary practices of exchange or by shattering those dependencies, instead generating southern solutions to southern problems. Elsewhere I have argued that south-south learning may lead cities toward more effective policy solutions,
