EDITOR'S PREFACE.

[Table of Contents](#)

In offering to the American public a new edition of DINKS and MAYHEW on the Dog, which, I am happy to find, is largely called for, I have been induced to make a further addition, which will, I think, render this the most perfect and comprehensive work in existence for the dog fancier and dog lover.

For myself I claim no merit, since, with the exception of one or two trivial changes in unimportant recipes in DINKS, and some abridgment of the last admirable work of Col. HUTCHINSON on Dog Breaking, which is now included in this volume, I have found occasion to make no alterations whatever, and, save a few notes, no additions.

I will add, in brief, that while I believe the little manual of Dinks to be the best short and brief compendium on the Dog, particularly as regards his breeding, conditioning, kennel and field management, and general specialities, there can be no possible doubt that Mayhew's pages are the *ne plus ultra* of canine pathology. There is nothing comparable to his treatment of all diseases for gentleness, simplicity, mercy to the animal, and effect. I have no hesitation in saying, that any person with sufficient intelligence to make a diagnosis according to his showing of the symptoms, and patience to exhibit his remedies, precisely according to his directions, cannot fail of success.

I have this year treated, myself, two very unusually severe cases of distemper, one of acute dysentery, one of chronic diarrhœa, and one of most aggravated mange, implicitly after his instructions, and that with perfect, and, in three instances, most unexpected, success. The cases of distemper were got rid of with less suffering to the animals, and with less—in fact, no—prostration or emaciation than I have ever before witnessed.

I shall never attempt any practice other than that of Mayhew, for distemper; and, as he says, I am satisfied it is true, that no dog, taken in time, and treated by his rules, *need* die of this disease.

Colonel Hutchinson's volume, which is to dog-breaking, what Mayhew's is to dog-medicining—science, experience, patience, temper, gentleness, and judgment, against brute force and unreasoning ignorance—I have so far abridged as to omit, while retaining all the rules and precepts, such anecdotes of the habits, tricks, faults, and perfections of individual animals, and the discursive matter relative to Indian field sports, and general education of animals, as, however interesting in themselves, have no particular utility to the dog-breaker or sportsman in America. Beyond this I have done no more than to change the word September to the more general term of Autumn, in the heading of the chapters, and to add a few short notes, explanatory of the differences and comparative relations of English and American game.

I will conclude by observing, that although this work is exclusively on breaking for English shooting, there is not one word in it, which is not applicable to this country.

The methods of woodcock and snipe shooting are exactly the same in both countries, excepting only that in England there is no summer-cock shooting. Otherwise, the practice, the rules, and the qualifications of dogs are identical.

The partridge, in England, varies in few of its habits from our quail—I might almost say in none—unless that it prefers turnip fields, potatoe fields, long clover, standing beans, and the like, to bushy coverts and underwood among tall timber, and that it never takes to the tree. Like our quail, it must be hunted for and found in the open, and marked into, and followed up in, its covert, whatever that may be.

In like manner, English and American grouse-shooting may be regarded as identical, except that the former is practised on heathery mountains, the latter on grassy plains; and that pointers are preferable on the latter, owing to the drought and want of water, and to a particular kind of prickly burr, which terribly afflicts the long-haired setter. The same qualities and performances constitute the excellence of dogs for either sport, and, as there the moors, so here the prairies, are, beyond all doubt, the true field for carrying the art of dog-breaking to perfection.

To pheasant shooting we have nothing perfectly analogous. Indeed, the only sport in North America which at all resembles it, is ruffed-grouse shooting, where they abound sufficiently to make it worth the sportsman's while to pursue them alone. Where they do so, there is no difference in the mode of pursuing the two birds, however dissimilar they may be in their other habits and peculiarities.

Bearing these facts in mind, the American sportsman will have no difficulty in applying all the rules given in the admirable work in question; and the American dog-breaker can by no other means produce so perfect an animal for his pains, with so little distress to himself or his pupil.

The greatest drawback to the pleasures of dog-keeping and sporting, are the occasional sufferings of the animals, when diseased, which the owner cannot relieve, and the occasional severity with which he believes himself at times compelled to punish his friend and servant.

It may be said that, for the careful student of this volume, as it is now given entire, in its three separate parts,

who has time, temper, patience, and firmness, to follow out its precepts to the letter, this drawback is abolished.

The writers are—all the three—good friends to that best of the friends of man, the faithful dog; and I feel some claim to a share in their well-doing, and to the gratitude of the good animal, and of those who love him, in bringing them thus together, in an easy compass, and a form attainable to all who love the sports of the field, and yet love mercy more.

YOUNG SPORTSMEN.

TO THE READER.

[Table of Contents](#)

No one work that I am aware of contains the information that is proposed for this little treatise, which does not aspire to any great originality of idea; but the author having experienced in his early days very great difficulty in finding to his hand a concise treatise, was induced to cull, from various authors what he found most beneficial in practice, into manuscript, and this collection he is induced to make public, in the hopes that any one "who runs may read," and, without searching through many and various voluminous authors, may find the cream, leaving the skim milk behind.

Wherever any known quotation is made, credit has been given to the proper persons, but it may be as well to state that most if not all of the Receipts are copies, though from what book is in a great measure unknown to the author, who extracted them in bygone days for his own use.

With this admission, he trusts that his readers will rest satisfied with the little volume which he offers to their indulgent criticism.

THE SPORTSMAN'S VADE MECUM

[Table of Contents](#)

BREEDING OF DOGS IN GENERAL.

[Table of Contents](#)

Before commencing to treat of the most correct methods to be observed in the breeding, it will be as well to mention

the different varieties of sporting dogs, and also the various sub-genera of each species, of which every one who knows anything of the subject need not be informed; but as this work affects to be a Vade Mecum for sportsmen, young far more than old, it is as well to put before the young idea certain established rules, not to be violated with impunity, and without following which no kennel can be great or glorious. A run of luck may perhaps happen, to set at naught all well defined rules, but "breeding will tell" sooner or later; and, therefore, it behoves any person who prides himself on his kennel, to study well the qualities of his dog or bitch, his or her failings and good qualities, and so to cross with another kennel as to blend the two, and form one perfect dog. This is the great art in breeding, requiring great tact and judgment.

POINTERS.

[Table of Contents](#)

The breed of Pointers, as now generally to be met with, is called "the English," distinguished by the lightness of limb, fineness of coat, and rattishness of tail. Fifteen or twenty years ago this style of dog was seldom seen; but, in place of it, you had a much heavier animal—heavy limbs, heavy head, deep flew-jaws, long falling ears. Which of these breeds was the best 'tis hard to say, but for America I certainly should prefer the old, heavy, English Pointer. Too much, I think, has been sacrificed to lightness, rendering him too fine for long and continued exertion, too susceptible to cold and wet, too tender skinned to bear contact with

briers and thorns, in fact, far too highly bred. Not that for a moment I am going to admit that American Pointers are too highly bred; far from it, for there is hardly one that, if his or her pedigree be carefully traced up, will not be found to have some admixture of blood very far from Pointer in its veins. Now this mongrel breeding will not end well, no matter how an odd cross may succeed, and the plan to be adopted is never to breed except from the most perfect and best bitches, always having in view the making of strong, well formed, tractable dogs, bearing in mind that the bitches take after the dog, and the dog pups after the dam, that temper, ill condition, and most bad qualities are just as inherent in some breeds as good qualities are in others. Here, then, to begin with, you have a difficult problem to solve; for, in addition to the defects of your own animal, you have to make yourself acquainted with those of the one you purpose putting to it. Is your dog too timid—copulate with one of high courage. But don't misunderstand me. In this there is as much difference between a high couraged and a headstrong dog as between a well bred dog and a cur. Is your dog faulty in ranging, may be too high, or may be no ranger at all, mate with the reverse, selecting your pups according to what has been stated above. If possible, always avoid crossing colors. It is a bad plan, but cannot always be avoided, for oftentimes you may see in an animal qualities so good, that it would be wrong to let him go past you. But, then, in the offspring, keep to your color.

From this general statement it will be easy to see, that in breeding dogs there is more science and skill required, more attention to minutiae necessary, than at first sight appears

to be the case. Long and deep study alone enables a person to tell whether any or what cross may be judicious, how to recover any fading excellence in his breed, or how best to acquire that of some one else. We will endeavor to give the experience of some fifteen years—devoted to this subject—to our readers, merely resting on our oars, to describe the various breeds of sporting dogs most desirable for him to possess, together with certain data on which to pin his faith in making a selection from a dealer, though as the eye may deceive, it is always as well to call in the ear as consulting physician, and by diligent inquiry endeavor to ascertain particulars.

The characteristics of a well bred Pointer may be summed up as follows: and any great deviation from them makes at once an ill bred, or, at all events, a deformed dog. To commence, then, at the head:—the head should be broad at top, long and tapering, the poll rising to a point; his nose open and large; his ears tolerably long, slightly erect, and falling between the neck and jaw bone, slightly pointed at the tip; eyes clear and bright; neck and head set on straight; his chest should be broad and deep—the contrary clearly shows want of speed and stamina; legs and arms strong, muscular, and straight; elbows well in; feet small and hard; body not over long, and well ribbed up—if not, he will be weak, and incapable of doing a day's work; loins broad at top, but thin downwards; hind quarters broad; hind legs strong and large; tail long, fine, and tapering; hair short, sleek, and close. Here you have the pure English Pointer, and as that is the best type of the dog, we shall not attempt to describe the Spanish one, which is not by any means

equal to the English, and is, moreover, so quarrelsome, that he cannot be kennelled with other dogs. Good dogs are of any colors, but the most favorite ones are liver and white, white and fawn, pure black, and pure liver. The two first, however, are better adapted for this country, being more easily seen in cover.

SETTER.

[Table of Contents](#)

We next come to the Setter. His head, like the Pointer should be broad at the top between the eyes; the muzzle though, must be longer and more tapering, and not over thick. Towards the eyes he must have a deepish indenture, and on the top of his skull a highish bony ridge. His ears should be long, pendulous, and slightly rounded. The eyes rather dark and full. His nose soft, moist, and large. Some breeds and breeders affect black noses and palates; but I must say that there are full as many good without the black as with it. I rather incline to the opinion that they are the best notwithstanding. Body like the Pointer, only deeper and broader, if anything; legs long to knee, short thence downwards; feet small, close, and thickly clothed with hair between the toes, ball and toe tufts they are termed; tail long, fine, and tapering, thickly feathered with long, soft, wavy hair; stern and legs down to feet also feathered. His body and feet also should be clothed with long, soft, silky hair, wavy, but no curl in it. This last smells badly of water spaniel. Colors, black and white, red and white, black and tan. These last I consider the finest bred ones. Roan also is

good. The Irish setter is red, red and white, white and yellow spotted. The nose, lips, and palate always black. He is also rather more bony and muscular than the English breed, and ten times as headstrong and enduring. He requires constant and severe work, under most rigid discipline, to keep in anything like decent subjection.

SETTER, RUSSIAN.

[Table of Contents](#)

The Russian Setter is as distinct from either of the above varieties as bulldog from greyhound. It is covered more profusely with long, thick, curly, soft, and silky hair, well on to the top of the head and over the eyes. He is also more bony and muscular, with a much shorter and broader head. What he wants in dash and ranging propensities, he makes up for in unwearied assiduity, extreme carefulness, and extraordinary scenting powers. The cross between this and either of the other setters is much valued by some breeders.

SPANIEL.

[Table of Contents](#)

Of Spaniels there are several varieties, but of these the Suffolk Cocker is the only one deserving a notice. All the others are too noisy, too heedless, and too quick on their legs. It is almost impossible to keep any one of them steady, and, therefore, in this country at least, they are totally useless, since you would not see them from the beginning to the end of the day. Yaff! yaff! half a mile off, all the time

putting up the birds, and you unable to stop them. The Suffolk Cocker, on the contrary, is extremely docile, can be easily broken, and kept in order. They are extremely valuable, thirty-five guineas being a low price for a brace of pure bred and well broken ones in England. The right sort are scarce, even there. Here, with two exceptions, I fancy they are not.

SPANIEL AND COCKER.

[Table of Contents](#)

In appearance they are much like a rased setter. The head and muzzle is much the same length and size; ears rather more rounded, but not so long; body deep, broad, and long; hair long and stiffish; legs and feet remarkably short, amounting almost to a deformity, and extraordinarily strong; tail short and bushy; it is usually curtailed a couple of joints. The purest colors are liver and white, fawn and white, and yellow and white. These dogs are slow and sure, remarkably close hunters, and obedient; just the things for cock shooting here. Too much cannot be said in their favor. They are easily taught to retrieve.

RETRIEVER.

[Table of Contents](#)

A Retriever is a cross breed dog. There is no true type of them. Every person has a peculiar fancy regarding them. The great object is to have them tolerably small, compatible with endurance. The best I have seen were of a cross

between the Labrador and water spaniel, or the pure Labrador dog.

BEAGLES.

[Table of Contents](#)

In some parts of the States Beagles are used, and it may be as well to point out the characteristics of them. First, then, a beagle ought not to exceed fourteen inches in height; its head ought to be long and fine; its ears long, fine also, beautifully round, thin, and pendulous, rather far set back; body not too long; chest broad and deep; loins broad at top, but narrow downwards; legs strong, but short; feet small and close; hair short and close; tails curved upwards and tapering, but not too fine. There is also another sort of beagles, wire-haired, flew-jawed, heavy hung, deep-mouthed. They are very true hunters, seldom leaving the trail till dead, or run to ground.

BREEDING.

[Table of Contents](#)

It is needless to say that at certain indefinite periods of the year a bitch comes into use, as the term is—generally twice a year, and still more generally speaking, during the time you most require her services, that is, April and September, spring snipe and grouse shooting, in consequence of which you must either sacrifice your pups or your sport. Now I am aware that in the States, for this reason, a bitch is seldom kept. For my part, I do not object

to them, for from experience I can so regulate their failings as to prevent their family cares from interfering with their hunting. The knowledge of this enables me to have my pups when I want them, to get the cover of a dog I fancy, when a strange one comes my way also. The best time, then, to put the bitch to the dog is early in January. By this means you have your pups ready to wean by the middle of April. They have all summer to grow in, get strong, and large, and are fit to break in October on snipe first, and then quail, finishing off on snipe the following spring. After this litter, the bitch probably comes into use again in the end of July or in August. Young ones are not so fond of it as old ones, and, consequently, for quail shooting, your bitch is all correct and well behaved, so far as regards the dam. I look upon the breeding of dogs from any except the best and most perfectly formed of their species, as an act of great folly. There are times when it must be done to keep up the breed, or to acquire one; for no one drafts his best bitches unless he is an ass. For my part, I keep five or six constantly, and draft yearly all my dog pups but two or three, say one pointer, setter, and cocker. By this means I have the pick out of a large number of well bred ones for myself, while the drafts pay the expenses of keep and breaking. This is impossible for every one to do, and they must pick up their dogs the best way they can. It is my intention for the future to draft my setters to New York and my pointers westward. My cockers, I fear, will not go off yet, my imported dog having taken it into his head to die, and, until he is replaced from England—I have no stock for breed. I could only get a chance of four while last there out of many valuable

kennels. However, I have promises of drafts from two or three parties, and ere summer cock come in, doubtless a brace or so will dare the perils of the sea for me; I have no hesitation in saying that, unless most amply remunerated, I would as soon sell my nose as the best pup in the litter, if I wanted it, nor would I advise any one else to do it. If done, you have to put up with inferior dogs. No; I breed to put a brace or so of the best young dogs yearly into my kennel, for my own use, and, while doing this, I also have, probably, ten good, well formed dogs to pick from, any one of which were one in want, would gladden the heart to get hold of. Sir William Stanley used to breed some fifty pointers yearly. Out of this lot, two brace were culled for his use. The rest were sold. They paid expenses. Many were excellent dogs, but he got the tip-top ones, and so he ought. This is the way a man who cannot afford to give great prices for good dogs must do, if he is much addicted to shooting. It requires two brace of dogs to do a day's shooting as it ought to be done. Each dog at full gallop the whole time, except, of course, when on birds; and to do this he must be shut off work about noon. Few dogs can go from morn till night without extreme fatigue. I never yet saw the dog that I could not hunt off his legs in a fortnight's hunt, taking him out every second day only, and feeding him on the best and strongest food. However, for general purposes, three brace of dogs are sufficient, and, when not often used, two are plenty; but no one ought ever to have less than two brace. It may be managed by always going out with a friend, he keeping one brace, you the other; he shooting to your dogs, you to his. For my part, give me three brace of my own, and let those

be the best shaped, strongest, best bred, and best workers there can be. That is my weakness, and to achieve this I yearly sink a sufficient number of dollars to keep a poor man. But all this is digressing most fearfully from the nursery of young pointers and setters.

BITCH IN USE.

[Table of Contents](#)

By receipt on a subsequent page, you will see how your bitch is to be brought into use. We will suppose her well formed and well bred. If faultless, put her to a dog nearly equal, if you cannot get one equal. Save the dog pups which will take after the dam. It is well understood that by breeding from young bitches you have faster and higher rangers; and this also reminds me to say that no bitch ought to be bred from till she is full grown, that is to say, till she is two years old. Many people breed at twelve months, but it is wrong. The bitch is not full grown, and, consequently, the puppies are poor, weak, and miserable. If the bitch has faults, find a dog of the same appearance as her, while he excels in those points she is deficient in. The bitches are partakers of his qualities. Are you short of bone, nose, size, form, temper, look for the excess of these. The cross, or, at all events, the next remove from it, will be just as you wish. Any peculiarity may be made inherent in a breed by sedulously cultivating that peculiarity. Avoid above all things breeding in and in brother and sister, mother and son, father and daughter—all bad, but the first far worse than either of the others, since the blood of each is the same.

The other two are only half so. To perfect form should be added high ranging qualities, high courage, great docility, keen nose, and great endurance. That is the acme of breeding. A few judicious crosses will enable you to acquire it for your kennel. To the inattention and carelessness of sportsmen to these points are to be attributed the innumerable curs we nowadays see in comparison to well bred dogs. Anything that will find a bird will do. Far otherwise, to my mind. "Nothing is worth doing at all if it is not to be well done," and I would as soon pot a bevy of quail on the ground, as think of following an ill bred, ill broken, obstinate cur. It may perhaps be as well to state, that when I spoke of "crosses," I had not the slightest intention of recommending a cross of pointer and setter or bull dog. Far otherwise. Let each breed be distinct, but cultivate a "cross," be they pointer or spaniel, from another kennel of another breed of the same class of dogs.

With regard to setters, a little separate talk is necessary, for we have three sorts, English, Irish, and Russian. The cross of English and Irish may and does often benefit both races. So also does the Russian, but I would be extremely careful how I put him to one or the other. Extreme cases may and do justify the admixture, but the old blood ought to be got back as soon as possible. He is of quite a different species to the other, though with the same types or characteristics, yet this cross is rather approaching to mongrel. Having descanted somewhat largely on the preliminary portion, we will pass on to the rearing of the progeny.

BITCHES IN PUP.

[Table of Contents](#)

Bitches in pup ought to be well fed, and suffered to run at large, and I am rather of opinion that by hunting them occasionally, or rather, by letting them see game while in this state, does not "set the young back any." Every one is aware of the sympathy between the mother and the unborn foetus, and I for one rather do think it of use.

Few bitches can rear more than six pups, many only four, and do them justice. Cull out, therefore, the ill colored, ugly marked bitches first, and if you find too many left, after a few days you must exercise your judgment on the dogs. I don't like, however, this murdering, and prefer, by extra feeding while suckling, and afterwards, to make up for pulling the mother down, which having to nurse six or seven pups does terribly. My idea always is in the matter, that the pup I drown is to be, or rather would be, the best in the litter. It is humbug, I know, but I cannot help it. At that age all else but color and markings is a lottery. Oft have I seen the poor, miserable little one turn out not only the best, but biggest dog. Therefore, I recommend the keeping of as many as possible.

Let the bitch have a warm kennel, with plenty of straw and shavings, or shavings alone. Let her be loose, free to go or come. Feed her well with boiled oatmeal in preference to corn meal—more of this anon in the feeding department, mixed in good rich broth, just lukewarm, twice a day; About the ninth day the pups begin to see, and at a month old they will lap milk. This they ought to be encouraged to do as

soon as possible, as it saves the mother vastly. At six weeks, or at most seven, they are fit to wean.

FEEDING PUPS AND WEANING.—LICE. —TEATS RUBBED.

[Table of Contents](#)

Feed them entirely on bread and milk, boiled together to pulp. Shut them in a warm place, the spare stall of a stable, boarded up at the end. Examine them to see whether they are lousy, as they almost always are. A decoction of tobacco water (*vide* receipt) kills them off. Rub the bitch's teats with warm vinegar twice a day till they are dried up. If this be not done, there is great danger of their becoming caked, besides causing her to suffer severely. She must have a mild dose of salts, say half an ounce, repeated after the third day. When the weather is fine, the young pups should be turned out of doors to run about. Knock out the head of a barrel, in which put a little straw, so that they may retire to sleep when they feel disposed. Feed them three times a day, and encourage them to run about as much as possible. Nothing produces crooked legs more than confinement, nothing ill grown weeds more than starvation; so that air, liberty, exercise, and plenty of food are all equally essential to the successful rearing of fine, handsome dogs. Above all things, never frighten, nor yet take undue notice of one over the rest. Accustom them to yourself and strangers. This gives them courage and confidence. Remember, if you ever should have to select a pup in this early stage, to get them all together, fondle them a little; the one that does not skulk

will be the highest couraged dog, the rest much in the same proportion, as they display fear or not. This I have invariably noticed is the case, and on this I invariably act when I have to select a pup, provided always he is not mis-formed. We have now brought our pups on till they can take care of themselves, and while they grow and prosper and get over the distemper, we will hark back a little, and say why we object to fall puppies,—simply because they are generally stunted by the cold, unless they are house-reared. They come in better, certainly, for breaking, but it is not so good to have them after September at the latest, unless it be down South, where, I fancy, the order of things would, or rather should, be reversed.

POINTER AND SETTER.

[Table of Contents](#)

Hitherto I have omitted to compare the respective merits of pointer and setter. This I had intended to have done altogether, but fearful lest fault should be found with me for doing so, I state it as my deliberate opinion, that there is nothing to choose between them "year in and year out." A setter may stand the cold better and may stand the briers better, but the heat and want of water he cannot stand. A pointer, I admit, cannot quite stand cold so well, but he will face thorns quite as well, if he be the right sort, and pure bred, but he don't come out quite so well from it as the setter does. The one does it because it don't hurt him, the other does it because he is told so to do, and his pluck, his high moral courage won't let him say no. For heat and

drought he don't care a rush, comparatively, and will kill a setter dead, were he to attempt to follow him. Westward, in the neighborhood of Detroit, the pros and cons are pretty equal. I hunt both indiscriminately, and see no difference either in their powers of endurance, see exceptions above, or hunting qualifications. For the prairies, however, I should say the pointer was infinitely superior, for there the shooting—of prairie hen—is in the two hottest months of the year, and the ground almost, if not quite, devoid of water. Therefore, the pointer there is the dog, and if well and purely bred, he is as gallant a ranger as the setter. Eastward, in New Jersey and Maryland, I am led to believe that setters may be the best there. Except "summer cock," all the shooting is in spring or late fall. Westward, we commence quail shooting on September the first. There, I believe, not until November the first. Here we have few or no briars or thorned things, save and except an odd blackberry or raspberry bush. There they have these and cat briars also, and that infernal young locust tree almost would skin a pointer. Therefore, for those regions, a setter is more preferable. Still more so the real springer.

BREAKING.

[Table of Contents](#)

We will now pass on to the breaking of our young dogs. This may be begun when they are four or five months old, to a certain extent They may be taught to "charge" and obey a trifle, but it must be done so discreetly that it were almost better left alone. Nevertheless, I generally teach them some

little, taking care never to cow them, one by one. This down-charging must be taught them in a room or any convenient place. Put them into the proper position, hind legs under the body, nose on the ground between their fore-paws. Retaining them so with one hand on their head, your feet one on each side their hind quarters, with the other hand pat and encourage them. Do not persist at this early age more than a few minutes at a time, and after it is over, play with and fondle them. At this time also teach them to fetch and carry; to know their names. Recollect that any name ending in o, as "Ponto," "Cato," &c., very common ones by the way, is bad. The only word ending in o ought to be "Toho," often abbreviated into "ho." This objection will be evident to any person who reflects for a moment, and a dog will answer to any other short two syllable word equally as well. These two lessons, and answering to the whistle, are about all that can or should be taught them.

RANGING, HOW TAUGHT.

[Table of Contents](#)

Nine months, or better, twelve, is soon enough to enter into the serious part of breaking. This is more to be effected by kind determination than by brute force. Avoid the use of the whip. Indeed, it never in my opinion ought to be seen, except in real shooting, instead of which we would use a cord about five or ten yards long. Fasten one end round the dog's neck, the other to a peg firmly staked in the ground; before doing this, however, your young dogs should, along with a high ranging dog, be taken out into a field where
