Contents

Volume 1

Preface *xiii*

- 1 Definitions and Types of Microbial Biopolyesters and Derived Biomaterials 1**
Martin Koller
- 1.1 Introduction 1
- 1.2 Biopolymers as Bioinspired Alternatives 2
- 1.2.1 Defining “Bioplastics” Is No Trivial Task! 2
- 1.2.2 Biodegradability of PHA and Other Biopolymers 8
- 1.2.3 PHA as Versatile Microbial Biopolyesters – Fields of Actual and Potential Applications 9
- 1.2.3.1 PHA as Packaging Materials 10
- 1.2.3.2 PHA as Implant Materials 11
- 1.2.3.3 PHA for Tissue Engineering 12
- 1.2.3.4 PHA as Drug Carrier Materials 14
- 1.2.3.5 PHA Biosynthesis Coupled to Bioremediation 15
- 1.2.3.6 Special Applications of PHA 16
- 1.2.3.7 Application of PHA’s Follow-Up Products 16
- 1.2.4 PHA Granules Are More than Simple Bioplastic Spheres 18
- 1.2.5 A Short Overview of the Metabolism of PHA Biosynthesis and Degradation 20
- 1.2.5.1 The Key Enzymes for PHA Biosynthesis 20
- 1.2.5.2 Factors Impacting PHA Synthases Activity 20
- 1.2.5.3 Intra- and Extracellular PHA Depolymerization 21
- 1.3 Types of PHA Biopolyesters 24
- 1.3.1 The “PHAome” Describes the High Complexity and Versatility of Natural PHA 24
- 1.3.2 PHA Homo- and Heteropolyesters 24
- 1.3.3 *Scl*-, *Mcl*-, and *Lcl*-PHA and Their Characteristics 24
- 1.3.3.1 *Scl*-PHA 25

1.3.3.2	<i>Mcl</i> -PHA	26
1.3.3.3	<i>Lcl</i> -PHA	27
1.3.4	Microstructure of PHA Heteropolyester	27
1.3.5	Factors Determining the Molecular Mass of PHA	29
1.3.5.1	General Aspects of PHA Molecular Mass	29
1.3.5.2	Impact of PHA Synthase Activity on PHA Molecular Mass	29
1.3.5.3	Impact of the Type of PHA Synthase on PHA Molecular Mass	30
1.3.5.4	Impact of Substrate Type and Feeding Conditions on PHA Molecular Mass	30
1.3.5.5	Production of Ultra-High-Molecular-Mass PHA	31
1.4	Conclusions	32
	References	33
2	Analysis of Chemical Composition of Biopolymers and Biomaterials: An XPS Study	45
	<i>Alenka Vesel and Miran Mozetic</i>	
2.1	Basics of X-Ray Photoelectron Spectroscopy (XPS)	45
2.1.1	Peak Fitting	50
2.2	Chemical Derivatization	53
2.3	Some Further Examples of XPS Analyses of Complex Organic Systems	55
2.4	Charging	58
2.5	Background Information	60
2.6	Angle-Resolved XPS (ARXPS)	63
2.7	Functional Coatings on Polymers	68
2.8	Practical Considerations	77
	Acknowledgments	77
	References	77
3	Methods for Characterization of Dielectric and Thermal Properties of Biomaterials	83
	<i>Daniela Ioniță, Mihai Asandulesa, and Mariana Cristea</i>	
3.1	Introduction to Thermal Analysis Techniques	83
3.1.1	Thermogravimetric Analysis	84
3.1.1.1	Applications	85
3.1.2	Differential Scanning Calorimetry	85
3.1.2.1	Principle	85
3.1.2.2	Applications of DSC	86
3.1.3	Dynamic Mechanical Analysis (DMA)	88
3.1.3.1	Principle	88
3.1.3.2	Applications of DMA	89
3.1.4	Broadband Dielectric Spectroscopy	89
3.1.4.1	Principle	90
3.1.4.2	Applications	90
3.2	The Significance of Thermal Analysis in Biopolymers	92

3.3	Applications of Thermal Analysis in the Characterization of Biopolymers	93
3.3.1	Characterization of the Thermal Stability of Biopolymers	93
3.3.2	Characterization of the Glass Transition of Biopolymers	94
3.3.3	Characterization of the Secondary Relaxations in Biopolymers	98
3.3.3.1	Secondary Relaxations in Cellulose	98
3.3.3.2	Secondary Relaxations in Chitosan	100
3.3.3.3	Secondary Relaxations in Pullulan	100
3.3.4	Characterization of Moisture from Hydrogels	101
3.3.5	Characterization of Electrical Conductivity	102
3.4	Conclusions	104
	References	105
4	Methods for Characterization of Surface Charge and Solid–Liquid Interaction Studies of Biomaterials	111
	<i>Matej Bračič, Lidija F. Zemljič, Olivija Plohl, and Thomas Luxbacher</i>	
4.1	Introduction	111
4.2	Surface Charge Characterization of Biomaterials	112
4.2.1	Potentiometric Titration	112
4.2.2	Zeta Potential	117
4.2.3	Application of the Zeta Potential for Biomaterial Characterization	123
4.2.3.1	Polyelectrolyte Multilayers	123
4.2.3.2	Polysaccharides	125
4.2.3.3	Electrospun Nanofibers	126
4.2.3.4	Skin and Bone	128
4.2.3.5	Biosensors	130
4.2.3.6	Lipids	130
4.3	Methods for Characterization of Solid–Liquid Interaction of Biomaterials	132
4.3.1	Quartz Crystal Microbalance and Surface Plasmon Resonance	132
4.3.2	Zeta Potential Measurements as a Tool to Study Solid–Liquid Interactions of Biomaterials	146
	References	148
5	Methods for Analyzing the Biological and Biomedical Properties of Biomaterials	165
	<i>Jan Rožanc and Uroš Maver</i>	
5.1	Introduction	165
5.2	Fundamentals of Cell Biology as a Base for Testing	167
5.3	In Vitro Methods for Analyzing Biomaterials	168
5.3.1	Cytotoxicity Tests	169
5.3.1.1	Direct Contact Tests	170
5.3.1.2	Indirect Contact Tests	171
5.3.1.3	Extracts/Elution Tests	171
5.3.2	Cell–Material Interaction Tests	171

5.3.2.1	Cell Morphology and Adhesion	171
5.3.2.2	Cell Viability Assay	173
5.3.2.3	Metabolic Activity Assay	174
5.3.2.4	Proliferation Assay	177
5.3.2.5	Cell Motility and Migration Assay	178
5.3.3	Hemocompatibility Tests	180
5.3.4	Genotoxicity and Carcinogenicity Testing	181
5.3.5	Monitoring Intracellular Activities	181
5.3.6	Real-Time Monitoring of Cell Culture Systems	183
5.3.7	High-Throughput Screening Systems	184
5.4	In Vivo Methods for Analyzing Biomaterials	185
5.4.1	Sensitization, Irritation, and Intracutaneous Reactivity	186
5.4.2	Biodegradation	187
5.4.3	In Vivo Genotoxicity	187
5.4.4	Systemic Toxicity	188
5.4.5	Implantation	189
5.5	Concluding Remarks and Perspectives	189
	References	191
6	Polysaccharide Thin Films – Preparation and Analysis	199
	<i>Carina Sampl and Stefan Spirk</i>	
6.1	Biopolymer Thin-Film Preparation	199
6.1.1	Direct Preparation of Cellulose Films	201
6.1.1.1	Thin Films from Cellulose Solutions	202
6.1.1.2	Thin Films from Colloidal Nanocellulose Dispersions	203
6.1.2	Indirect Preparation of Cellulose Films from a Soluble Derivative	205
6.2	Characterization of Biopolymer Thin Films	208
6.2.1	Surface Morphology	208
6.2.2	Thin-Film Thickness	210
6.2.3	Elemental Composition	211
6.2.4	Functional Groups and Hydrogen-Binding Patterns	213
6.2.5	Wettability	215
6.2.6	Surface Charge	216
6.2.7	Thin-Film Structure	218
6.2.8	Swelling and Adsorption Behavior	220
6.3	Conclusion	224
	References	225
7	Biopolymer Thin Films as “Smart” Materials in Biomedical Applications	239
	<i>Tanja Zidarič and Uroš Maver</i>	
7.1	Introduction	239
7.2	Frequently Used Biopolymers	240
7.2.1	Cellulose	240
7.2.2	Starch	241

7.2.3	Chitin and Chitosan	242
7.2.4	Alginate	243
7.2.5	Gelatin	244
7.2.6	Polyhydroxyalkanoates (PHA)	245
7.2.7	Polylactic Acid (PLA)	246
7.2.8	Biopolymer Composites	247
7.3	Stimuli-Responsive Biopolymer Thin Films	248
7.3.1	pH-Responsive Biopolymers	248
7.3.2	Thermo-Sensitive Biopolymers	250
7.3.3	Redox-Sensitive Biopolymers	251
7.4	Biomedical Applications of Biopolymers	251
7.4.1	Drug-Delivery Systems	251
7.4.2	Wound-Healing Materials	253
7.4.3	Bioactive Coatings for Medical Devices and Implants	255
7.4.4	Bioelectronics (Biocomposites)	256
7.5	Conclusions	259
	Acknowledgment	260
	References	260

8 Biopolymer-Based Nanofibers – Synthesis, Characterization, and Application in Tissue Engineering and Regenerative Medicine 269

Merin S. Thomas, Prasanth K. S. Pillai, Sabu Thomas, and Laly A. Pothan

8.1	Introduction	269
8.2	Different Strategies of Nanofiber Development	270
8.2.1	Drawing	270
8.2.2	Template Synthesis	270
8.2.3	Phase Separation	270
8.2.4	Self-Assembly	271
8.2.5	Electrospinning	271
8.2.5.1	Advantages of Electrospun Nanofibers	272
8.3	Biopolymers	272
8.3.1	Chitosan Nanofibers	272
8.3.2	Cellulose Nanofibers	273
8.4	Characterization Techniques	274
8.4.1	Morphological Analysis	274
8.4.2	Scanning Electron Microscopy (SEM)	274
8.4.2.1	Transmission Electron Microscopy (TEM)	274
8.4.2.2	Atomic Force Microscopy (AFM)	275
8.4.3	Mechanical Characterization	275
8.4.3.1	Nanotensile Test	275
8.4.3.2	Nanoindentation	276
8.5	Applications	276
8.5.1	Tissue Engineering	276
8.5.2	Drug Delivery	277

- 8.5.3 Wound Healing 278
- 8.5.4 Biosensors 279
- 8.6 Conclusions 280
- References 280

9 Formation of Polysaccharide-Based Nanoparticles and Their Biomedical Application 287

Thomas Elschner

- 9.1 Introduction 287
- 9.2 Nanoparticle Formation 287
 - 9.2.1 Nanoprecipitation by Dropping Technique 288
 - 9.2.1.1 Methodology 288
 - 9.2.1.2 Examples 290
 - 9.2.2 Dialysis 291
 - 9.2.2.1 Methodology 291
 - 9.2.2.2 Examples 291
 - 9.2.3 Emulsification–Evaporation 292
 - 9.2.3.1 Methodology 292
 - 9.2.3.2 Examples 293
 - 9.2.4 Miscellaneous Nanoparticle Formation 295
- 9.3 Interaction with Cells 295
 - 9.3.1 Cellular Uptake 295
 - 9.3.2 Nanospheres of Organo-Soluble 6-Deoxy-6-(ω -Aminoalkyl) Amino Cellulose Carbamates 296
- 9.4 Release Mechanisms 297
- 9.5 Examples in Therapeutics and Diagnostics 298
- References 299

Volume 2

Preface *xi*

10 Advanced Methods for Design of Scaffolds for 3D Cell Culturing 305

Boštjan Vihar, Marko Milojević, Luka Banović, and Uroš Maver

11 Methods and Challenges in the Fabrication of Biopolymer-Based Scaffolds for Tissue Engineering Application 335

Daniela Ivanov

12 Solvent-Casting Approach for Design of Polymer Scaffolds and Their Multifunctional Applications 371

Blessy Joseph, Cintil Jose, Sagarika V. Kavi, Nandakumar Kalarikkal, and Sabu Thomas

- 13 Freeze-Casted Biomaterials for Regenerative Medicine 395**
Selestina Gorgieva, Silvo Hribernik, Alenka Ojstršek, and Manja Kurečič
- 14 Polysaccharide-Based Stimuli-Responsive Nanofibrous Materials for Biomedical Applications 419**
Manja Kurečič, Beste Elveren, and Selestina Gorgieva
- 15 Cells Responses to Surface Geometries and Potential of Electrospun Fibrous Scaffolds 445**
Urszula Stachewicz
- 16 Biopolymer Beads for Biomedical Applications 465**
Poonam Trivedi, Subhash Tripathi, and Pedro Fardim
- 17 Recent Advances in 3D Printing in the Design and Application of Biopolymer-Based Scaffolds 489**
Marko Milojević, Uroš Maver, and Boštjan Vihar
- Index 561**

10 Advanced Methods for Design of Scaffolds for 3D Cell Culturing 305

Boštjan Vihar, Marko Mitojević, Luka Banović, and Uroš Maver

- 10.1 Introduction 305
- 10.2 General Considerations in Tissue Engineering 306
 - 10.2.1 3D Cell Culture 306
 - 10.2.2 Scaffold-Free Tissue Engineering 307
 - 10.2.3 Scaffold-Based Tissue Engineering 307
 - 10.2.4 Definitions and General Terminology 308
- 10.3 Building Scaffolds 309
 - 10.3.1 Techniques Without Computer-Aided Design and Manufacturing 310
 - 10.3.1.1 Phase Separation 310
 - 10.3.1.2 Foaming 312
 - 10.3.1.3 “Textile” Methods 312
 - 10.3.1.4 Electrospinning 312
 - 10.3.1.5 Ultrasound Patterning 312
 - 10.3.1.6 Decellularized Tissues and Organs 313
 - 10.4 Computer-Aided Design and Manufacturing 313
 - 10.4.1 Subtractive Manufacturing 314
 - 10.4.2 Additive Manufacturing 314
 - 10.4.2.1 Droplet-Based Techniques 315
 - 10.4.2.2 Inkjet Bioprinting 316
 - 10.4.2.3 Microvalve-Based Bioprinting 316
 - 10.4.2.4 Extrusion-Based Techniques 316
 - 10.4.2.5 Freeform Embedded Bioprinting 317
 - 10.4.2.6 Sacrificial Bioprinting 318
 - 10.4.2.7 Core–Shell Bioprinting 319
 - 10.4.2.8 Multicomponent and Microfluidic Bioprinting 319
 - 10.4.2.9 Melt Electrowriting 320
 - 10.4.2.10 Photopolymerization 321
 - 10.4.2.11 Laser-Assisted Bioprinting 323
 - 10.5 Challenges and Future Outlook 325
- References 326

11	Methods and Challenges in the Fabrication of Biopolymer-Based Scaffolds for Tissue Engineering Application	335
	<i>Daniela Ivanov</i>	
11.1	Introduction	335
11.2	Conventional Methods for 3D Scaffold Engineering	337
11.2.1	Fluid-Based Technologies	337
11.2.1.1	Melt-Based Processing – Melt Molding	337
11.2.1.2	Solution-Based Processing	343
11.2.2	Textile Technologies for 3D Scaffold Engineering	347
11.2.2.1	Woven, Knitted, and Braided Methods	348
11.2.2.2	Nonwoven Methods: Electrospinning	349
11.2.3	Hydrogel Scaffolds Fabrication	350
11.2.4	Self-Assembly Methods	351
11.2.5	Microsphere-Based Scaffolds Fabrication	352
11.3	Advanced Fabrication Methods – Solid Freeform Fabrication	353
11.3.1	Stereolithography	354
11.3.2	Selective Laser Sintering	355
11.3.3	Nozzle-Based Deposition Techniques	355
11.3.3.1	Fused Deposition Modeling	355
11.3.3.2	3D Printing and 3D Bioprinting	356
11.3.4	Indirect Rapid Prototyping	357
11.4	Conclusions and Future Perspectives	358

Preface

Broadening the spectrum of biopolymers, their classification, chemical nature, isolation, and characterization is very important for better understanding the usability of biopolymers in new applications. It is also important for the development of completely new materials based on the special properties of polysaccharides (cellulose-based and others) compared to the biomaterials currently used in various high-tech applications (e.g. inorganic materials and non-degradable synthetic polymers). In this context, this book focuses largely on the fundamental knowledge of biopolymers (natural: cellulose and its derivatives; other polysaccharides such as chitosan, glycosaminoglycans (GAG's), etc.; and synthetic ones such as polyethylene terephthalate and others), their origin, classifications, chemical nature, and isolation methods. This book also covers various classical and modern approaches to the transformation of these biopolymers into different forms, from thin films (model surfaces), nanoparticles, nanofibers, to 3D scaffolds. The application of these biopolymer-based multifunctional materials (e.g. 2D thin films to 3D scaffolds) in applications such as biosensors (e.g. for detection of DNA, antibodies, affibodies, and moisture sensors), antifouling surfaces, drug delivery systems, microfluidic devices, microarrays, two-photon absorption lithography, enzymatic digestion systems, wound models, to name a few important areas are also discussed in detail. A library of analytical methods used for the analysis of morphology, structure, shape, thermal, electrical, and surface properties, as well as for the study of solid-liquid interaction of biomaterials, is also covered in detail in this book.

It also provides a comprehensive overview of the latest developments in the applicability of biopolymers, especially polysaccharides, for the production of sustainable biomaterials used in medicine, focusing on potential applications and future developments. Therefore, it is unique and of interest not only to students and scientists but also to industry as well as stakeholders and policy makers. This coincides with recent trends to replace fossil materials with indigenous materials. In addition, readers will get an overview of the specific and very special properties of biopolymers that can be used for the production of sustainable but high-quality functional biomaterials. Overall, this book will contribute to a better understanding of the physicochemical properties of biopolymers and their use in the preparation of completely new materials for various advanced biomedical applications. In summary, there are no books

to date that deal exclusively with the classification, isolation, preparation, and characterization of biopolymers and the design of new functional biomaterials, with a particular emphasis on the application of biomaterials in various advanced technological applications.

The content of the book is formulated to serve as a reference for the fundamental understanding of biopolymers/biomaterials and can be used by academicians, industrialists, researchers, graduate, and undergraduate students.

1.1 Introduction

The increasing quantities of petrol-based plastics used for numerous applications in our daily life are among the most prevailing ecological threats of our days. In this regard, we are steadily confronted with phrases currently circulating in the media such as “plastic contamination of marine ecosystems,” “microplastic,” “growing garbage dumps,” and “bans on everyday plastic materials” such as traditional “plastic shopping bags” or, more recently, cotton swabs with plastic rods or plastic drinking straws. Indeed, the currently produced plastics amount to more than 400 megatons (Mt) annually; their production exploits limited fossil resources, and, after their life span, these plastics need to be disposed of due to their lacking biodegradability [1–3]. In the beginning of 2020, approximately 150 Mt of plastics have already accumulated in the world’s oceans alone, estimated to cause perishing of 100 000 marine mammals and about ten times as many birds year by year [4]. Just the other day, the dramatic death of a sperm whale carrying an unbelievable number of around eighty plastic bags in its, making it impossible for the animal to take organic food, and shocked the general public [5]. Only recently, Zheng et al. reported an estimate that, by 2050, the global production of plastics will quadruple, which will be connected with a doubling of plastic waste [6].

In fact, significantly less than one third of plastic waste is recycled in Europe, the rest ends up in landfills or in the environment, or is simply burned [7]. In this context, the increased release of microplastics from recycled food containers, especially from plastic bottles (“Re-PET”), into food, been described [8]. Moreover, it should be noted that recycling of plastic delays, rather than prevents, its final disposal in landfills [9]. Landfilled plastic waste, in turn, returns to the sea via detours, such as wind or river systems, and finally enters the food chain as microplastic and eventually into the human metabolism. This cycle applies to about 500 000 t

of plastic waste per year in the EU alone. It is self-explanatory that this represents enormous risks for the biosphere and the health of the entire world population. But from the resource-technological perspective as well, our today's dependence on plastic is inadequate, unsustainable, and short sighted not only because current plastics production depends on exploiting limited fossil resources, but also because most plastic products are *per definitionem* designed as disposable products for single use only. This circumstance is a major environmental "fire accelerator"; as typical "end-of-the-pipe" product, plastics donate high short-term benefits through their favorable nature and, at the same time, are available at the discount price.

In particular, microplastics directly endanger food security and human health; starting from their consumption by plankton, such microplastics, which *per definitionem* have particle sizes ranging from 0.1 to 5.000 μm , easily climb up the entire trophic chain, until they finally get accumulated in its top, namely the human metabolism. Only during the last few years, concrete understanding of the detritus mechanisms of microplastic on the ecosystem and the metabolism of animals and humans is developing. In addition to microplastic uptake via the trophic chain, diverse techniques during food production using equipment with plastic parts, in addition to food storage in plastic containers like bottles, are also direct source of microplastic contamination of food, mainly by abrasion and by the currently fashionable use of recycled poly(ethylene terephthalate) (PET) bottles [8]. The documentation and quantification of possible diverse effects of microplastics on human health is currently only in its infancy. In 2018, microparticles in the size of 50–500 μm of a total of nine different petrochemical plastics, predominately poly(propylene) (PP) and PET, were for the first time clearly identified by an Austrian research team in the human intestine [10]. Considering the fact that the deterioration of intestine cells (villi) by microplastics was already demonstrated for fish and nematodes [11], it has to be expected that such microplastic particles also cause negative reactions in the human intestine, such as inflammation or even cancer. Moreover, by intestinal uptake, microplastics could potentially be transported to the blood and lymph system and to various organs.

To change this situation, a reasonable and fair pricing of plastics is required, reflecting not only its benefits but also the damage caused by the high environmental footprint of this end-of-pipe technology. In this way, plastics would no longer be disposed of in bulk; even more important, a fair pricing would, wherever possible, foster the production and implementation of alternative materials like bioinspired alternatives in order to finally find the way out of the "plastic predicament" [4].

1.2 Biopolymers as Bioinspired Alternatives

1.2.1 Defining "Bioplastics" Is No Trivial Task!

Looking back to the very beginnings of the "plastic age," we remember that the first plastic-like polymer indeed was biobased, namely natural *cis*-1,4-poly(isoprene) rubber obtained from the rubber tree *Hevea brasiliensis* (reviewed by Wycherley [12]).

However, especially the decades between 1940 and the turn of the millennium were dominated by synthetic, not biodegradable, polymers of petrochemical origin. As a real alternative to many of the currently used plastics, one can switch to bio-inspired alternatives [13]. In this context, we have to be careful when talking about “bioplastics,” which is a scientifically ambiguous expression. It is of major importance to differentiate different groups of “bioplastics”:

- (a) Plastics that are biobased (originating from renewable resources) and, at the same time, biosynthesized (monomers converted to polymers by the action of living organisms), and biodegradable/compostable. Prime examples: microbial polyhydroxyalkanoates (PHA life cycle). As additional characteristic, PHAs are also biocompatible; hence, they do not exert any negative effect on the biosphere surrounding them (e.g. living organisms, cell lines, ecosystems) according to the standardized ISO 10993 norm. Other natural polymers, which can be processed to generate materials with plastic-like properties (e.g. processing starch to thermoplastic starch [14] – TPS life cycle; see Figure 1.1), or others, e.g. proteins gelatin [15], whey proteins [16], etc., chitin [17], or cellulose [18], which are compatible with PHA and other polymers, also belong to the group of biopolymers *sensu stricto*.
- (b) Plastics that are biobased and biodegradable/compostable, but not biosynthesized (monomers converted to polymers by classical chemical methods, often demanding toxic catalysts). Prime example: poly(lactic acid) (PLA), which currently is considered a competitor of PET or poly(styrene) (PS); for the life cycle of PLA, please refer to Figure 1.2. Here, one has to consider high recalcitrance of highly crystalline PLA toward biodegradation and restrictions regarding its *in vivo* biocompatibility [19].
- (c) Plastics that are biobased, but neither biosynthesized nor biodegradable/compostable. Prime example: biobased poly(ethylene) (bio-PE), which resorts to chemical conversion of saccharose to ethylene via ethanol and chemical polymerization of ethylene to PE (life cycle; see Figure 1.3). Such “bio-PE” is currently strongly emerging regarding its market volume, which is expected to amount to estimated 300 000 t per year in 2022. In 2018, even the company LEGO™ switched to bio-PE to manufacture their globally famous toy bricks; however, bio-PE is not biodegradable, and its production exploits food resources [20]. Partly, this group also encompasses the “green bottle” commercialized by The Coca Cola™ company, which consists of so-called “biobased PET”; however, this material has a biobased carbon content stemming from renewable resources (the ethylene part) of only 30%, and is not biodegradable/compostable [21].
- (d) Other plastics are not biobased and not biosynthesized, but still biodegradable/compostable; they have a petrochemical origin. Prime examples are poly(ϵ -caprolactone) (PCL [22] life cycle: see Figure 1.4), or the random copolyester poly(butylene adipate terephthalate) (PBAT), which is used for materials commercialized by, e.g. the company BASF SE under the trade name Ecoflex® and follow-up products ([23] life cycle: see Figure 1.5). These materials enter the natural cycle of carbon after being biodegraded; hence, they do not
