Foreword

Mathematics is the universal tool for the scientist,

„... for the mathematic is the basis of all exact scientific knowledge...“

(David Hilbert, German mathematician, 1862-1943).

Special attention is therefore paid to learning how to use the tool. As is so often the case, the realisation of the necessity paired with the motivation of the user is in the foreground. If the declared aim is to describe physical relationships by means of mathematics, this does not necessarily require thematic rigour. The application of mathematical rigour is likely to be counterproductive to this concern. Furthermore, Gödel's incompleteness theorem of mathematics applies, which even shows mathematics itself its limitations. Experience has shown that the users' desire for mathematical rigour can be observed when they are convinced and enthusiastic about mathematics and its possibilities. For this reason, mathematical rigour should not be given the highest priority at the beginning. Mathematics lives from the joy of its users and applications!

„It is impossible to adequately convey the beauties of the laws of nature if someone does not understand mathematics. I regret that, but it is probably so.“

(Richard Feynman, physicist and Nobel Prize winner, 1918 1988),
denn

„The book of nature is written in the language of mathematics.“

(Galileo Galilei, 1564 1642).

Calculator, paper, pencil and eraser in combination with coffee form a good basis. Mathematics is the universal tool of electrical engineering. Selected mathematical methods are also used to deal with selected topics in electrical engineering. The work is carried out by presenting the basics, describing the task and solving the problem in detail. The target group of readers also results from this procedure. From the author's point of view, these are:

- Students of engineering sciences who would like to work on scientific topics using mathematical methods.
- Software engineers who want to implement differential equations in matrix form in microprocessors.
- Simulation engineers who would like to calculate something „on foot“.
- Measurement engineers who need a measurement value from a location where no sensor can be adapted and only calculations can be made for this location.
- Maths brave, pale in the face, survived and now want to try maths again.

Since our science has a mirror-image structure, it is worthwhile, for example, to familiarise oneself in depth with a scientific discipline. Here, electrical engineering is preferably recommended. By changing the coefficients of a differential equation, the

enthusiastic reader of this book conquers another scientific discipline (hence the use of the term "mirror image"). For example, anyone who can solve electrical networks (meshes) can consequently also solve thermal, magnetic, mechanical and hydraulic networks. The mathematical basics include calculation rules, definitions, matrices, ordinary and partial differential equations and coordinate systems. They provide access to understanding the chosen mathematical methods and applications in electrical engineering. An elementary application in electrical engineering is the LCR oscillating circuit, which is described with differential equations and whose properties are presented. The integral transformation, the method of moments and Green's method have in common the formation of the inner product for the solution of differential equations. The last two methods are introduced in detail with the help of examples. With the method of moments, the transition to the finite element method (FEM) and finite difference method (FDM) is made using application examples. The method of moments is also used to introduce the eigenvalue problem. The development of infinite series by alternately applying the law of flow and the law of induction leads to Bessel functions as well as to the phenomenon of field displacement with the effect of current displacement in the conductor. Selected standards should provide the reader with hints for the preparation of scientific documentation. A note on the extended use of the book is permitted: New exercises can be generated by simply modifying the original problem that has already been solved. The modification of the original task should be done in such a way that its solution is already known in advance. This gives the possibility to compare the results and to further deepen the familiarisation. Because the following always applies

„Uncertain are the calculations of the dispersible“

(Wisdom Literature).

With kind regards the
author

Contents

1	Required mathematical basics	1
1.1	Logarithm	1
1.2	Matrices	3
1.2.1	Arithmetic operations with matrices	3
1.2.2	Addition and subtraction of two matrices	3
1.2.3	Multiplication of a matrix with a scalar	4
1.2.4	Square matrix	4
1.2.5	Identity matrix	4
1.2.6	Determinant	5
1.2.7	Subdeterminant or minor	6
1.2.8	Adjuncts or algebraic complement	6
1.2.9	Inverse matrix	7
1.2.10	Transposed of a matrix	8
1.2.11	Complex conjugate matrix	9
1.2.12	Hermite conjugate matrix	9
1.2.13	Hermitian matrix – self-adjoint matrix	10
1.2.14	Orthogonal matrix	10
1.2.15	Unitary matrix	11
1.2.16	Normal matrix	12
1.2.17	Norm of a matrix	12
1.2.18	Conditioned matrix equation and condition number	13
1.2.19	Eigenvalue, eigenvector	14
1.2.20	Square matrices – a summary	16
1.3	Integral, differential equations	18
1.3.1	Definitions	18
1.3.2	Differentiation of scalar functions	19

1.3.3	Higher order ordinary differential equations	19
1.3.4	Partial differential equations	21
1.3.5	Partial integration	23
1.3.6	Classification of differential equations	23
1.3.7	Initial value task	24
1.3.8	Boundary value problem	25
1.3.9	Linear operators	26
1.3.10	Inner product	28
1.3.11	Strong form/formulation of a differential equation	31
1.3.12	Weak form/formulation of a differential equation	31
1.4	Vector classification	31
1.5	Differentiation rules for vectors	32
1.6	Vector operators	33
1.6.1	Nabla and Laplace operator	33
1.6.2	Vector operator Gradient	34
1.6.3	Vector operator Divergence	35
1.6.4	Vector operator Curl	36
1.6.5	Comparison of vector operators	37
1.6.6	Rules of calculation for the Nabla operator	37
1.6.7	Comparison scalar and vector product	38
1.6.8	Base, unit vectors	39
1.7	Boundary operator ∂	40
1.8	Maxwell's equations	41
1.8.1	Relationship between circular and surface integral	41
1.8.2	Relation between area integral and volume integral	42
1.8.3	Maxwell's equations – differential form	43
1.8.4	Maxwell's equations – integral form	43
1.8.5	Directional assignment of involved vector fields	44
1.9	Dirac's delta function	44
2	Coordinate systems	47
2.1	Cartesian coordinate system	47
2.2	Cylinder coordinate system	49
2.3	Sphere coordinate system	51

3	Geometric mean distance – GMD	55
3.1	Geometric mean distance – what for?	55
3.2	Geometric mean distance – definitions and basics	58
3.2.1	Euclid – The Elements (extracts)	58
3.2.2	Arithmetic means – definition	58
3.2.3	Geometric mean – definition	59
3.2.4	GMD – possible combinations	60
3.2.5	GMD – graphical interpretation	61
3.2.6	Why geometric mean?	66
3.3	GMD of two collinear lines	66
3.3.1	GMD calculation – numerical solution	67
3.3.2	GMD calculation – analytical solution	67
3.3.3	GMD calculation – example	68
3.4	GMD of a collinear arrangement between a point and a line	72
3.4.1	GMD calculation – numerical solution	73
3.4.2	GMD calculation – analytical solution	73
3.4.3	GMD calculation – example	74
3.5	GMD of a line on itself	76
3.5.1	GMD calculation – analytical solution	76
3.5.2	GMD calculation – numerical solution	77
3.5.3	GMD calculation – summary	78
3.6	GMD of two parallel lines	79
3.6.1	GMD calculation – numerical solution	79
3.6.2	GMD calculation – analytical solution	80
3.6.3	GMD calculation – example	81
3.7	GMD of a point and a helix	83
3.7.1	Length of an unwound helix	84
3.7.2	GMD calculation – analytical solution	86
3.8	GMD point outside line with its perpendicular on line centre	86
3.8.1	GMD calculation – numerical solution I	87
3.8.2	GMD calculation – numerical solution II	88
3.8.3	Analytical solution and example calculation	89
3.8.4	GMD calculation – summary	90
3.9	GMD point outside line with its perpendicular on line end	90
3.9.1	GMD calculation – radius right at the element	91

3.9.2	GMD calculation – radius left at the element	94
3.9.3	GMD calculation – analytical solution	97
3.9.4	GMD calculation – summary and evaluation	98
3.10	GMD point outside line with its perpendicular inside line	98
3.10.1	GMD calculation – radius right at the element	99
3.10.2	GMD calculation – radius left at the element	101
3.10.3	GMD calculation – superposition	103
3.10.4	GMD calculation – analytical solution	104
3.10.5	GMD calculation – Summary and evaluation	105
4	LCR parallel and series resonant circuit	107
4.1	Resonant circuits, impedances and resonances	107
4.2	Natural frequency – error calculation	111
4.3	Voltage profiles LCR series resonant circuit with frequency variation	112
4.3.1	Voltage characteristics across the inductance	113
4.3.2	Voltage characteristics across inductance and resistance	115
4.3.3	Voltage characteristics across the resistor	116
4.3.4	Voltage characteristics across capacitance	118
4.4	Damped forced LCR series resonant circuit	119
4.5	Damped free LCR series resonant circuit	123
4.6	Undamped free LC resonant circuit	125
4.7	Damped forced LCR parallel resonant circuit	126
4.8	Damped free LCR parallel resonant circuit	131
4.9	Undamped free LC resonant circuit	135
5	Current displacement in conductor	137
5.1	Current displacement in the conductor – modelling	138
5.2	Current displacement in the conductor – calculation result	142
5.3	Current displacement in the conductor – simulation result	143
5.4	Current displacement in conductors – summary	145
6	Bessel equation and Bessel function	147
6.1	On the person Wilhelm Friedrich Bessel	148
6.2	Bessel equation and solutions	148
6.3	Bessel equation of the field diffusion equation	150
6.4	Bessel function for calculating the field distribution in a capacitor	153

6.4.1	Model arrangement	153
6.4.2	Derivation of the Bessel function	153
6.5	Bessel function for calculating the flux density within a coil	157
6.5.1	Model arrangement	157
6.5.2	Derivation of the Bessel function	157
6.6	Bessel function from general form of Bessel equation	160
7	Solution of differential equations using Green's functions	165
7.1	About George Green	165
7.2	Green's integral theorems	168
7.3	PDE – arrangements of evaluation points and integration points	169
7.4	PDE – preparation for solution by Green's – differential form	172
7.5	PDE – preparation for solution by Green's – integral form	174
7.5.1	Converting the PDE according to the variable to be solved	174
7.5.2	Homogeneous boundary conditions	175
7.5.3	Inhomogeneous boundary conditions	176
7.5.4	Dirichlet boundary conditions	176
7.5.5	Neumann boundary conditions	177
7.6	PDE – solution of Poisson's DGL	177
7.6.1	Exercise description	178
7.6.2	Solution path	178
7.7	PDE – solution of Laplace's DGL	181
7.7.1	Exercise description	181
7.7.2	Solution path	181
7.8	ODE – Preparation for the solution with the Green's function	183
7.8.1	Homogeneous boundary conditions	185
7.8.2	Inhomogeneous boundary conditions	185
7.8.3	Continuity and discontinuity conditions	186
7.9	ODE – solution of $d^2u/dx^2 = -1 (I)$	187
7.9.1	Exercise description	188
7.9.2	Solution I	189
7.9.3	Solution II	192
7.10	ODE – solution of $d^2y/dx^2 + y = \operatorname{cosec} x$	195
7.10.1	Exercise description	195
7.10.2	Solution	195

7.11	ODE – solution of $d^2y/dx^2 + y = f(x)$	197
7.11.1	Exercise description	198
7.11.2	Solution path	198
7.12	ODE – solution of $d^2u/dx^2 = -1$ (II)	200
7.12.1	Exercise description	200
7.12.2	Solution path	201
7.13	ODE – solution of $d^2u/dx^2 = x$	203
7.13.1	Exercise description	203
7.13.2	Solution path	204
8	Method of Lagrangian multipliers	209
8.1	Definition of the Lagrange multiplier method	209
8.1.1	Properties of the method	209
8.1.2	Mathematical optimisation	210
8.1.3	Calculus of variations	212
8.2	Derivation of the Lagrange multiplier method	212
8.3	Application of the method	214
8.4	Maths example – extreme value problem with one constraint	214
8.5	Maths example – extreme value problem with two constraints	216
8.6	Application example – cube inscribed in a sphere	218
8.6.1	Extreme value problem with one constraint	218
8.6.2	Solution with Lagrange multiplier method	219
8.6.3	Solution with elimination method	220

Symbols and abbreviations

Symbol	Meaning	Unit
A	coefficient, matrix	
A	area	m^2
B	coefficient, matrix	
B, \vec{B}	magnet. flux density, vector of magnet. flux density	Vs/m^2
B_h	interpolation, approach function	
C	coefficient, matrix	
C	capacity	As/V
C	heat capacity	J/K
D	coefficient, Charge	
D	charge density	As/m^2
D	discriminant	
E	coefficient, matrix	
E, \vec{E}	electric field strength, electric field strength	V/m
\mathcal{E}	length-related electric field strength	V/m^2
F	coefficient, function	
F	force	$N, kgm/s^2$
G	Green's function	
G	coefficient	
H, \vec{H}	magnet. field strength, vector of the magnet	A/m
H_Φ	field interpolation function, approach function	
I	current	A
J, \vec{J}	electr. current density, vector of electr. current density	A/m^2

Symbol	Meaning	Unit
K	constant	
L	inductivity	Vs/A
M	matrix	
N	number of nodes, line elements, running variable, number of turns	
P	power	W
P	polynomial function, evaluation point	
P'	source point, integration point	
Q	charge	As
R	residuum	
R	radius	m
R	resistance	Ω
S	matrix	
S_P	vertex	
U	voltage	V
V	volume	m^3
W	Wronski determinant	
X	reactance, reactance	Ω
$Z, \underline{Z} $	impedance, magnitude of the impedance	Ω
\underline{Z}	impedance (complex impedance)	Ω
a	coefficient	
a_0	acceleration	m/s^2
b	damping coefficient	kg/s
c	constant	
c	spring constant	N/m
c	speed of light	m/s
c	specific heat capacity	$J/(kgK)$
d	diameter	m
e	e-function	
\vec{e}	unit vector	
f	auxiliary variable, function, matrix, column vector	
g	auxiliary variable, function, matrix	
h	element length, distance, height	m

Symbol	Meaning	Unit
i	control variable	
i	current	A
j	control variable	
j	imaginary unit	$\sqrt{-1}$
k, \underline{k}	constant, complex constant	
l	length	m
l	matrix	
m	control variable	
m	mass	kg
n	normal, number of partial intervals	
p	impulse	$kg\ m/s$
p	variable, function	
r	radius	m
s	constant	
s	distance, length	m
t	time	s
u	function, interpolation, approach function	
u	voltage	V
\hat{u}_0	voltage amplitude	V
v	function, interpolation, approach function	
v	speed	m/s
w	weight, weighting, test, shape function	
x	coordinate, path	m
y	coordinate, path	m
y	function	
z	coordinate, path	m
Γ	edge of the FEM area	
Δ	delta, differential	
Θ	magnetomotive force	A
Φ	magnetic flux	Vs
Ψ	chained magnetic flux	Vs
Ω	area, sub-area, element	m^2

Symbol	Meaning	Unit
α	coefficient	
β	coefficient	
γ	Coefficient, boundary value	
δ	decay constant	
ε	permittivity	$As/(Vm)$
ε_0	permittivity of the vacuum $[8, 8542 \cdot 10^{-12} As/(Vm)]$	$As/(Vm)$
v	temperature	$^{\circ}C$
κ	specific electrical conductivity	$m/(\Omega mm^2)$
λ	thermal conductivity	$W/(mK)$
λ	eigenvalue, Lagrange multiplier	
μ	permeability	$Vs/(Am)$
μ_0	permeability of the vacuum $[4\pi 10^{-7} Vs/(Am)]$	$Vs/(Am)$
ρ	density	kg/m^3
ρ	volume charge density	As/m^3
τ	time constant	s
v_h	approach, test function	
φ	potential	V
φ	interpolation, approach function, angle	
φ	angle	rad
ϕ	development, base, triangular function	
ω	angular velocity, angular frequency	$1/s$
$\Delta A, \Delta A'$	differential surface elements	m^2
$\Delta x, \Delta y$	differential line elements	m
dA	infinitesimal surface element	m^2
dx, dy	infinitesimal line elements	m
\mathcal{L}	linear operator	
\mathcal{M}	linear operator	
\mathcal{O}	zero operator	
\mathcal{I}	identity operator	
∇	Nabla operator	
Δ	Delta operator	

Chapter 1

Required mathematical basics

„Last time I asked: What does mathematics mean to you?, and some people answered: The manipulation of numbers, the manipulation of structures. And if I had asked what music means to you, would you have answered: The manipulation of notes?“

(Serge Lang, French-American mathematician, 1927-2005) from *„The beauty of doing Mathematics“*. Serge Lang became known for his work on algebraic geometry and number theory and as the author of many textbooks.

The basics required for the numerical solution of differential equations have been compiled in this chapter. These essentially include matrices, definitions and classifications of differential equations as well as initial and boundary value problems and vector operators. Particularly recommended literature for this are [4], [60] and [67].

1.1 Logarithm

The logarithm of x (numerus, logarithmand) to the base a is the real number b (exponent), for which the following applies

$$\begin{aligned}\log_a x &= b \\ a^b &= x.\end{aligned}$$

The logarithm to the base 10 is called the decadic or Briggsian logarithm. It follows

$$\log_{10} x = \lg x$$

and it applies

$$\log(x \cdot 10^\alpha) = \alpha + \log x.$$

Examples of this are

- Example 1:

$$\begin{aligned} \log(5 \cdot 10^1) &= 1 + \log 5 \\ &= 1,698 \end{aligned}$$

- Example 2:

$$\begin{aligned} \log(5 \cdot 10^2) &= 2 + \log 5 \\ &= 2,69. \end{aligned}$$

Furthermore

$$\log_a a^\alpha = \alpha + \log_a m$$

with the numerus or logarithm a , mantissa m and α the index of the logarithm, equal to the exponent of the place value of the first significant digit of the numerus. See also [1], S. 56. In summary, some more useful logarithmic laws are

- Multiplication of the independent parameters

$$\log_a(u \cdot v) = \log_a u + \log_a v$$

- Division of the independent parameters

$$\log_a\left(\frac{u}{v}\right) = \log_a u - \log_a v$$

- Exponentiation of the independent variable

$$\log_a u^v = v \log_a u$$

- Squaring of the independent variable

$$\log_a \sqrt[v]{w} = \log_a w^{\frac{1}{v}} = \frac{1}{v} \log_a w.$$

1.2 Matrices

The matrix notation summarises the calculations with functions and thus increases the overview. For this purpose, a vector operator summarises derivatives. These are marked with a simple symbol (Nabla or Laplace operator). The matrix notation (matrix equations) enables the numerical solution of linear systems of equations by means of the solution methods known in the literature. Therefore, matrix and matrices receive special attention. Selected matrix operations are presented here. These include the necessary matrix calculation rules, the inversion, multiplication of a matrix, matrix textures as well as determinant calculation rules, and much more. Recommended literature is [60], p. 268 ff. and [29], p. 12 ff. (Random matrices – new universal laws).

1.2.1 Arithmetic operations with matrices

Table 1.1 summarises the most important algebraic axioms.

Table 1.1: Summary of the most important calculation rules

Associative law	$\mathbf{A} (\mathbf{BC}) = (\mathbf{AB}) \mathbf{C}$
Distributive law	$\mathbf{A} (\mathbf{B}+\mathbf{C}) = \mathbf{AB} + \mathbf{AC}$ $(\mathbf{A}+\mathbf{B}) \mathbf{C} = \mathbf{AC} + \mathbf{BC}$
Transpose	$(\mathbf{AB})^T = \mathbf{B}^T \mathbf{A}^T$

Note that matrix multiplication is not commutative, which is

$$\mathbf{A} \cdot \mathbf{B} \quad \neq \quad \mathbf{B} \cdot \mathbf{A}.$$

1.2.2 Addition and subtraction of two matrices

Two matrices \mathbf{A} and \mathbf{B} of the same type are added or subtracted by adding or subtracting their corresponding elements

$$\mathbf{A} \pm \mathbf{B} \quad = \quad (a_{ik} \pm b_{ik}) = \mathbf{C},$$

with $i = 1, 2, 3, \dots, m$ and $k = 1, 2, 3, \dots, n$ and \mathbf{C} the sum or difference matrix. Addition and subtraction are only defined for matrices of the same type (m, n) .
