Professor G.S. Khush (August 22, 1935)

Professor G.S. Khush was born in a small village in Punjab, India, and did B.Sc. in 1955 from Government Agricultural College (now Punjab Agricultural University), Ludhiana, and Ph.D. in 1960 from the University of California, Davis. After serving as an Assistant Geneticist at University of California, Davis, for 7 years, he joined International Rice Research Institute (IRRI), Los Banos, Philippines (1967), as a Plant Breeder. He was promoted as Head of Plant Breeding Department in 1972 and became Principal Plant Breeder and Head of Division of Plant Breeding, Genetics and Biochemistry (1986). Professor Khush is a world-renowned plant breeder who has made enormous contribution to the development of more than 300 high-yielding rice varieties that played significant role toward achieving “Green Revolution,” thereby boosting rice production. Professor Khush provided excellent leadership for the global rice improvement program benefiting millions of resource-poor rice growers in the world. A semi-dwarf rice variety IR36 developed by him was one of the most widely grown rice varieties in the world during 1980s. IR64 developed during 1980s is the most widely planted rice variety in the world. In India, Professor Khush has been actively involved in the development of Plant Breeding and Agriculture Biotechnology. He has authored 3 books, edited 6 books, 40 review articles, 45 book chapters, and 160 research papers. His scientific work featured in the most prestigious international journals. Professor Khush received many awards and honors from various scientific bodies, such as Borlaug Award (1977), Japan Prize (1987), World Food Prize (1996), Rank Prize (1998), Wolf Prize (2000), and Padma Shri from the President of India. He received D.Sc. (hc) degrees from 10 universities, including Punjab Agricultural University, Jawahar Lal Nehru Agriculture University, De Montfort University, Cambridge University, and Ohio State University. He is elected to the Fellowship of Indian Academy of Sciences, Bangalore; National Academy of Sciences (India), Allahabad; National Academy of Agricultural Sciences, New Delhi; Indian National Science Academy (INSA), New Delhi; the Academy of Sciences for the Developing World; Chinese Academy of Sciences; Russian Academy of Agricultural Sciences; US National Academy of Sciences; and The Royal Society (London). At present, Professor Khush is serving as Adjunct Professor in University of California, Davis.

This book is dedicated to Prof. G.S. Khush, the undisputed Hero of Rice Revolution.

Contents

Foreword	<i>XIX</i>
Preface	<i>XXI</i>
List of Contributors	<i>XXV</i>

PART I	Climate Change and Abiotic Stress Factors	1
1	Climate Change and Food Security	3
	<i>R.B. Singh</i>	
1.1	Background and Introduction	3
1.2	State of Food Security	6
1.3	Climate Change Impact and Vulnerability	9
1.4	Natural Resources Management	13
1.5	Adaptation and Mitigation	17
1.6	Climate Resilient Agriculture – The Way Forward	18
	References	22
2	Improving Crop Productivity under Changing Environment	23
	<i>Navjot K. Dhillon, Satbir S. Gosal, and Manjit S. Kang</i>	
2.1	Introduction	23
2.1.1	Global Environmental Change Alters Crop Targets	28
2.1.2	Crop Productivity	28
2.1.3	Climatic Factors Affecting Crop Production	29
2.1.3.1	Precipitation	29
2.1.3.2	Temperature	29
2.1.3.3	Atmospheric Humidity	30
2.1.3.4	Solar Radiation	30
2.1.3.5	Wind Velocity	30
2.1.4	Plant Genetic Engineering	31
2.1.4.1	Engineering for Herbicide Resistance	32
2.1.4.2	Engineering for Insect Resistance	32
2.1.4.3	Engineering for Disease Resistance	33

2.1.4.4	Engineering for Improving Nutritional Quality	36
2.1.4.5	Engineering for Male Sterility	36
2.1.4.6	Engineering for Molecular Farming/Pharming	37
2.1.4.7	Engineering for Improving Postharvest Traits	37
2.1.4.8	Engineering for Abiotic Stress Tolerance	38
2.1.5	Molecular Breeding	39
2.2	Conclusions	40
	References	40
3	Genetic Engineering for Acid Soil Tolerance in Plants	49
	<i>Sagarika Mishra, Lingaraj Sahoo, and Sanjib K. Panda</i>	
3.1	Introduction	49
3.2	Phytotoxic Effect of Aluminum on Plant System	50
3.2.1	Al-Induced Morphophysiological Changes in Roots	50
3.2.2	Negative Influence of Al on Cytoskeletal Network of Plant Cells	51
3.2.3	Interaction of Al ³⁺ Ions with Cell Wall and Plasma Membrane	52
3.2.4	Oxidative Stress Response upon Al Stress	52
3.3	Aluminum Tolerance Mechanisms in Plants	53
3.3.1	Preventing the Entry of Al into Plant Cell	53
3.3.2	Role of Organic Acids in External and Internal Detoxification of Al	54
3.4	Aluminum Signal Transduction in Plants	55
3.5	Genetic Approach for Development of Al-Tolerant Plants	56
3.6	Transcriptomics and Proteomics as Tools for Unraveling Al Responsive Genes	59
3.7	Future Perspectives	60
	References	61
4	Evaluation of Tropospheric O₃ Effects on Global Agriculture: A New Insight	69
	<i>Richa Rai, Abhijit Sarkar, S.B. Agrawal, and Madhoolika Agrawal</i>	
4.1	Introduction	69
4.2	Tropospheric O ₃ Formation and Its Recent Trend	71
4.2.1	Projected Trends of Ozone Concentrations	74
4.3	Mechanism of O ₃ Uptake	75
4.3.1	Mode of Action	76
4.3.2	O ₃ Sensing and Signal Transduction	76
4.3.3	ROS Detoxification Mechanisms: From Apoplast to Symplast	77
4.3.4	Physiological Responses	80
4.3.4.1	Photosynthesis	80
4.3.5	Cultivar Sensitivity in Relation to Growth and Yield	84
4.4	Looking Through the “-Omics” at Post-Genomics Era	87
4.4.1	Evolution of Multi-Parallel “-Omics” Approaches in Modern Biology	87
4.4.2	“-Omics” Response in Ozone-Affected Crop Plants: An <i>In Vivo</i> Assessment	87

- 4.4.2.1 Case Studies in Major Crop Plants 88
- 4.5 Different Approaches to Assess Impacts of Ozone on Agricultural Crops 92
- 4.6 Tropospheric O₃ and Its Interaction with Other Components of Global Climate Change and Abiotic Stresses 94
 - 4.6.1 Elevated CO₂ and O₃ Interaction 94
 - 4.6.2 O₃ and Drought Interaction 95
 - 4.6.3 O₃ and UV-B Interaction 95
- 4.7 Conclusions 96
- References 97

PART II Methods to Improve Crop Productivity 107

5 Mitogen-Activated Protein Kinases in Abiotic Stress Tolerance in Crop Plants: “-Omics” Approaches 109

Monika Jaggi, Meetu Gupta, Narendra Tuteja, and Alok Krishna Sinha

- 5.1 Introduction 109
- 5.2 MAPK Pathway and Its Components 112
 - 5.2.1 MAP3Ks 112
 - 5.2.2 MAP2Ks 114
 - 5.2.3 MAPKs 114
- 5.3 Plant MAPK Signaling Cascade in Abiotic Stress 115
 - 5.3.1 MAPK Cascades under Salt Stress 117
 - 5.3.2 Drought Stress-Induced MAPKs 117
 - 5.3.3 Temperature Stress Response and MAPK Cascades 119
 - 5.3.4 Activation of MAPKs by Oxidative Stress 120
 - 5.3.5 Ozone-Induced MAPKs 121
 - 5.3.6 Wounding-Induced MAPKs 121
 - 5.3.7 MAPKs in Heavy Metal Signaling 122
- 5.4 Crosstalk between Plant MAP Kinases in Abiotic Stress Signaling 122
- 5.5 “-Omics” Analyses of Plants under Abiotic Stress 123
- 5.6 Conclusions and Future Perspectives 127
- Acknowledgments 128
- References 128

6 Plant Growth Promoting Rhizobacteria-Mediated Amelioration of Abiotic and Biotic Stresses for Increasing Crop Productivity 133

Vasvi Chaudhry, Suchi Srivastava, Puneet Singh Chauhan, Poonam C. Singh, Aradhana Mishra, and Chandra Shekhar Nautiyal

- 6.1 Introduction 133
- 6.2 Factors Affecting Plant Growth 134
 - 6.2.1 Biotic Stress 135
 - 6.2.2 Abiotic Stress 135
- 6.3 Plant-Mediated Strategies to Elicit Stresses 136

6.3.1	Osmoadaptation	137
6.3.2	Antioxidative Enzyme Production	137
6.3.3	Effect of Stress on Plant Nutrient Uptake	137
6.4	Plant Growth Promoting Rhizobacteria-Mediated Beneficiaries to the Environment	138
6.4.1	PGPR as Abiotic Stress Ameliorating Agent	138
6.4.2	PGPR Action against Multiple Pathogens	139
6.4.3	Determinants of PGPR Colonization in Stressed Environment	140
6.4.4	PGPR-Mediated Induction of Defense Mechanism	143
6.4.5	Modulation of Plant Genes through Bacterial Intervention	144
6.5	PGPR-Based Practical Approaches to Stress Tolerance	145
6.5.1	Development and Commercialization of PGPRs: Approaches and Limitations	145
6.5.2	Implications of Bacterial Genes for Transgenic Development	146
6.6	Conclusions	147
	References	147
7	Are Viruses Always Villains? The Roles Plant Viruses May Play in Improving Plant Responses to Stress	155
	<i>Stephen J. Wylie and Michael G.K. Jones</i>	
7.1	Introduction	155
7.2	Viruses Are Abundant and Diverse	156
7.3	Wild Versus Domesticated	156
7.4	New Encounters	157
7.5	Roles for Viruses in Adaptation and Evolution	158
7.6	Conclusions	160
	References	160
8	Risk Assessment of Abiotic Stress Tolerant GM Crops	163
	<i>Paul Howles and Joe Smith</i>	
8.1	Introduction	163
8.2	Abiotic Stress	164
8.3	Abiotic Stress Traits are Mediated by Multiple Genes	165
8.4	Pleiotropy and Abiotic Stress Responses	167
8.5	General Concepts of Risk Analysis	168
8.6	Risk Assessment and Abiotic Stress Tolerance	169
8.6.1	Choice of Comparator	171
8.6.2	Production of an Allergenic or Toxic Substance	171
8.6.3	Invasiveness and Weediness	172
8.6.4	Pleiotropic Effects	173
8.6.5	Gene Transfer to Another Organism	175
8.7	Abiotic Stress Tolerance Engineered by Traditional Breeding and Mutagenesis	176
8.8	Conclusions	177
	Acknowledgments	177

Foreword

Agriculture is now at a crossroad of conservation and sustainability along with the challenge of increasing productivity. Global agricultural land is limited; the same is true for the water availability and other natural resources. However, population is increasing, particularly in the developing countries. The vertical growth of crop productivity is the only way to meet the daunting task and ensure food security for ever-increasing population. I am glad to see this book addressing those issues and providing scientific know-how to solve some of the problems. I firmly believe that genetic potential of the crop productivity can be utilized and further improved through science and technology interventions.

Several chapters including (1) Climate Change and Food Security by Dr R.B. Singh, (2) Improving Crop Productivity under Changing Environment by Drs Dhillon, Gosal, and Kang, (3) Are Virus Always Villains? The Roles Plant Viruses May Play in Improving Plant Responses to Stress by Drs Wylie and Jones, (4) Risk Assessment of Abiotic Stress-Tolerant GM Crops by Drs Howles and Smith, (5) Rice: Genetic Engineering Approaches for Abiotic Stress Tolerance – Retrospects and Prospects by Dr Singh *et al.*, (6) Groundnut: Genetic Approaches to Enhance Adaptation of Groundnut (*Arachis hypogaea* L.) to Drought by Rao *et al.*, (7) Pulse Crops: Biotechnological Strategies to Enhance Abiotic Stress Tolerance by Drs Ganeshan, Gaur, and Chibar, and so on make focused discussions on the subject. All chapters are well written and create a scientific interest in the learners/readers and researchers.

Congratulations and my best compliments to editors of this book Drs N. Tuteja, Sarvajeet S. Gill, and R. Tuteja who performed an outstanding work in getting valuable contributions from some world experts on the relevant subject. I am sure the readers in the field of agriculture and particularly in abiotic stress management, biotechnology, and new genetics in plant breeding would find this book very useful. The publisher also deserves congratulations for publishing this useful book.

ICAR, New Delhi

Prof. Swapan K. Datta, FNAAS, FNASc
Deputy Director General (Crop Science)
ICAR, New Delhi

Preface

The world's population is projected to hit ~9.2 billion in 2050. On the other hand, agricultural production is decreasing because of negative implications of global climate change. Therefore, it has become essential to increase the global agricultural production to feed the increasing population. Globally, a major loss in crop production is imposed by a suite of stresses, resulting in 30–60% yield reduction every year. Abiotic stress factors such as heat, cold, drought, salinity, wounding, heavy metal toxicity, excess light, floods, high-speed wind, nutrient loss, anaerobic conditions, radiation, and so on represent key elements affecting agricultural productivity worldwide. In an agriculturally important country, agriculture is the main driver of agrarian prosperity and comprehensive food and nutritional security. The loss of productivity is triggered by a series of morphological, physiological, biochemical, and molecular stress-induced changes. Therefore, minimizing these losses is a major area of concern for the whole world.

Genetic engineering of abiotic stress-related genes is an important objective for increasing agricultural productivity. Plant adaptation to environmental stresses is dependent on the activation of cascades of molecular networks involved in stress perception, signal transduction, and the expression of specific stress-related genes and metabolites. Consequently, these genes that protect and maintain the function and structure of cellular components can enhance tolerance to stress. Genetic engineering of important genes and QTLs have now become valuable tools in crop improvement for rapid precision breeding for specific purposes. Additionally, drip irrigation and fertigation, leaf color chart (LCC) for need-based application of nitrogen, sensor-based yield monitors, nitrogen sensors/green seekers, special-purpose vehicles with sensor-based input applicators, integrated nutrient management (INM) systems, integrated pest management (IPM) systems, integrated disease management (IDM) systems, site-specific management systems using remote sensing, GPS, and GIS, and Web-based decision support systems for controlling diseases and insect pests have been developed and are being commercialized for precision farming.

In this book "Improving Crop Productivity in Sustainable Agriculture," we present a collection of 19 chapters written by 55 experts in the field of crop improvement and abiotic stress tolerance. This volume is an up-to-date overview of current progress in improving crop quality and quantity using modern methods. Included

literature in the form of various chapters provides a state-of-the-art account of the information available on crop improvement and abiotic stress tolerance for sustainable agriculture. In this book, we present the approaches for improving crop productivity in sustainable agriculture with a particular emphasis on genetic engineering; this text focuses on crop improvement under adverse conditions, paying special attention to such staple crops as rice, maize, and pulses. It includes an excellent mix of specific examples, such as the creation of nutritionally fortified rice and a discussion of the political and economic implications of genetically engineered food. The result is a must-have hands-on guide, ideally suited for the biotech and agro industries. This book best complements our previous title “Improving Crop Resistance to Abiotic Stress” (ISBN 978-3-527-32840-6, Volumes 1 and 2, Wiley-Blackwell, 2012).

For the convenience of readers, the whole book is divided into three major parts, namely, Part I: Climate Change and Abiotic Stress Factors; Part II: Methods to Improve Crop Productivity; and Part III: Species-Specific Case Studies. Further, Part III has been divided into three sections, namely, Section IIIA: Graminoids; Section IIIB: Leguminosae; and Section IIIC: Rosaceae. Part I covers four chapters. Chapter 1 deals with climate change and food security, where emphasis has been paid to food security and climate resilient agriculture. Chapter 2 uncovers the ways for improving crop productivity under changing environment. Chapter 3 deals with the approaches such as genetic engineering for acid soil tolerance in crop plants, whereas Chapter 4 focuses on the evaluation of tropospheric O₃ effects on global agriculture. Part II covers five chapters. Chapter 5 deals with “-omics” approaches for abiotic stress tolerance where emphasis has been paid to understand the importance of mitogen-activated protein kinases in abiotic stress tolerance in crop plants. Chapter 6 unravels the importance of plant growth promoting rhizobacteria for the amelioration of abiotic and biotic stresses for increasing crop productivity. Chapter 7 interestingly uncovers the importance of viruses in reducing damage from both biotic and abiotic stressors in crop plants. This chapter focuses on the new technologies that revealed that viruses are far more abundant and diverse than previously known and unexpected roles as symbionts and as sources of genetic raw material for evolution are informing a new appreciation of the roles plant viruses play in nature. Chapter 8 is on risk assessment of abiotic stress-tolerant GM crops. This chapter outlines the likely issues for consideration in risk assessment for the commercial release of a GM plant with a novel abiotic stress tolerance trait. Chapter 9 is on biofertilizers as potential candidate for crop improvement under stressed conditions. Part III deals with different crop plants under three sections. Section IIIA covers four chapters that deal with rice, pearl millet, and bamboo. In this section, Chapter 10 deals with the genetic engineering approaches for abiotic stress tolerance in rice – retrospects and prospects. Chapter 11 uncovers the genetic engineering approaches to enhance grain iron content in rice. The creation of nutritionally fortified rice can have a dramatic impact on human health because it is a major staple crop in the world. Chapter 12 deals with the genetic improvement for tolerance to abiotic stresses in pearl millet. Chapter 13 deals with the application of plant tissue culture techniques for genetic improvement of bamboo

(*Dendrocalamus strictus* Nees). Section IIIB includes four chapters on groundnut, chickpea, grain legumes, and pulse crops. Chapter 14 deals with genetic approaches to enhance adaptation of groundnut (*Arachis hypogaea* L.) to drought stress. Chapter 15 discusses the strategies for crop improvement under changing environment conditions in chickpea. Chapter 16 deals with grain legumes, where biotechnological interventions in crop improvement for adverse environments have been discussed. Chapter 17 uncovers the biotechnological strategies to enhance abiotic stress tolerance in pulse crops. Section IIIC includes two chapters on *Fragaria* and rose. Chapter 18 deals with improving crop productivity and abiotic stress tolerance in cultivated *Fragaria* using “-omics” and systems biology approach. Chapter 19 discusses the strategies for improving crop productivity in rose. The editors and contributing authors hope that this book will add to our existing knowledge of improving crop productivity in sustainable agriculture that, in turn, may eventually open up new avenues for improving the stress tolerance in crop plants.

We are highly thankful to Dr. Ritu Gill, Centre for Biotechnology, MD University, Rohtak, for her valuable help in formatting and incorporating editorial changes in the manuscripts. We would like to thank Prof. Swapan K. Datta, Deputy Director General (Crop Science), ICAR, New Delhi, for writing the foreword and Wiley-Blackwell, Germany, particularly Gregor Cicchetti, Senior Publishing Editor, Life Sciences, and Anne Chassin du Guerny for their professional support and efforts in the layout. This book is dedicated to Professor G.S. Khush, the undisputed Hero of Rice Revolution.
