[Figure 1.1 The London 2012 Olympic Parklands and Public Realm project, which received a Civic Trust](#)

award for Recognition of Excellence in the Built Environment, is a good example of inclusive design in practice.

Figure 1.2 Good, clear signs help everyone.

Figure 1.3 A good level of accessibility can benefit a wide range of people, including people with disabilities.

Figure 1.4 Car parking spaces designated for blue badge holders may need to be managed to ensure correct use.

Figure 1.5 Access to historic buildings can be improved with sensitive, well-designed alterations.

Figure 2.1 A low ticket desk can help service providers fulfil their duties under the Equality Act.

Figure 2.2 Refurbishment can offer opportunities for improving access, such as adding a lift to a change of level.

Figure 2.3 Adding automatic opening to doors can make access more convenient and help service providers fulfil their duties under the Equality Act.

Figure 2.4 Chairs with firm seats and armrests improve access in a waiting area.

Figure 2.5 Access is not just a matter of ramps and WCs – playgrounds should be accessible too.

Figure 2.6 This school reception desk has a visually contrasting, split level counter with a well-designed low section with knee space.

Figure 2.7 Level access increases the accessibility of trams.

Figure 2.8 The ramp added to this town hall is designed to be sympathetic to the character of the building and improve access to local services.

Figure 2.9 A change of level at the entrance to a building can be overcome by gently ramping the pavement.

Figure 2.10 Guidance on stairs and handrails is given in Approved Documents M and K.

Figure 2.11 Tactile edging can be used to help warn of potential hazards, such as this water feature.

Figure 2.12 Information on the alarm call procedure in an accessible WC can inform people of management procedures and provide reassurance.

Figure 3.1 BS 8300 gives information on all aspects of design to meet the needs of disabled people, including stairs, tactile warning and the provision of spaces for wheelchair users as provided at Wembley Stadium.

Figure 3.2 Lifts can provide good access for everyone and should be designed to follow British Standards and other good practice guidance.

Figure 3.3 Access to the Foundling Museum in London was improved with a sensitively designed ramp and steps at the main entrance.

Figure 3.4 The London Olympic Park was designed to allow easy and convenient access for everyone.

Figure 4.1 A ramp may be provided as a short-term solution while awaiting a major refurbishment of the building.

Figure 4.2 A sensitive addition to improve access to a historic building.

Figure 4.3 Good access solutions, such as this platform lift, should be noted in an access audit as well as access problems.

Figure 4.4 A gently sloping ramp provides access and, in this case, also provides a route over the gravel surface.

Figure 4.5 When carrying out an access audit, effective door opening width should be checked as well as opening pressure, vision panels, door handles and visual contrast.

Figure 4.6 An access audit should check not only that induction loops are provided at reception desks and are clearly signed, but also check if they operate correctly.

Figure 4.7 A platform lift added beside a stepped change of level at the entrance of a library can improve access.

Figure 4.8 Good visual contrast, clearly showing where doors are located in a corridor, should be maintained when the building is repainted.

Figure 5.1 Car park showing excellent use of signage, ground markings and pedestrian routes.

Figure 5.2 Good clear signage, correct drainage, and firm non-slip surfaces are essential. Routes between parking areas should be clear and well defined; bollards can prevent encroachment.

Figure 5.3 Parking is at same level as entrance to the shopping area with a clearly defined route.

Figure 5.4 Setting down and pick-up points should be clearly marked with dropped kerbs. Care should be taken to ensure bollards do not obstruct routes.

Figure 5.5 Seating can be useful on longer routes. Armrests can help people when sitting or standing.

Figure 5.6 Good surfaces and level entrances are necessary, but management control of potential

obstructions is also required.

Figure 5.7 A smooth path can be laid across an uneven surface to provide an accessible route.

Figure 5.8 A good approach to a building can greatly enhance people's perception of it as well as its accessibility.

Figure 5.9 The width of a path should allow people to pass each other easily.

Figure 5.10 Potential tripping hazards should be highlighted using visual contrast.

Figure 5.11 Projections into the walking zone can be very dangerous for all people, but especially people with visual impairments. Projections should be avoided, or at least properly protected, at all times.

Figure 5.12 Seating should be located where it does not obstruct routes and should be clearly visible.

Figure 5.13 Automatic sliding doors provide good access for everyone.

Figure 5.14 Manifestation should be able to be seen in all lighting conditions. It can also be used to help identify entrances.

Figure 5.15 Automatic swing doors should be clearly signed and the swing area protected.

Figure 5.16 Manifestation on entrance doors can be used to provide information about the building as well as increase the visibility of the doors.

Figure 5.17 Systems used to control access and for communication must be accessible, and usable, for everyone.

Figure 5.18 This car park control requires reach, dexterity, speech, hearing and a right arm. It is possible

to hold a driver's licence without one or more of the above, but you need all of them if you wish to enter this car park. Is this reasonable provision?

Figure 5.19 Reception desks should be clearly visible. A low section with an overhang allows close approach by wheelchair users.

Figure 5.20 This desk has a low section - but the writing shelf and the lack of knee space might prevent easy use by a wheelchair user.

Figure 5.21 Route to the reception desk is identified; however, colour and luminance contrast would have made this information available to a greater number of people.

Figure 5.22 How many doors are there? Reflective finishes can be very confusing for someone with poor vision.

Figure 5.23 Many people would find this floor finish disconcerting, but especially those with poor vision, older people and people using mobility aids such as crutches. It may not be the selection of floor finish that is the problem, but the highly polished finish and the lighting.

Figure 5.24 Are the squares manifestation on the glass or decoration on the train? Critical information is lost - even for those with good vision.

Figure 5.25 Good use of visual contrast clearly identifies these WC doors.

Figure 5.26 Each step nosing should contrast with the remainder of the tread and should be clearly visible when ascending and descending stairs.

Figure 5.27 Tapered risers can present a serious tripping hazard and should be avoided.

Figure 5.28 The area below overhanging stairs should be guarded.

Figure 5.29 When a vertical platform lift is provided, it should be adjacent to the stair with which it is associated.

Figure 5.30 A gently sloping ramp provides access to an existing historic building.

Figure 5.31 A ramp with a gradient of 1 in 12 may be too steep for people to use easily and conveniently.

Figure 5.32 All ramps should have appropriately designed handrails.

Figure 5.33 Contrasting nosings and well-designed handrails can help people use stairs.

Figure 5.34 Handrails should be designed to allow people's hands to pass along the rail uninterrupted by fixings.

Figure 5.35 A platform lift added beside a stepped change of level at the entrance to an historic building can improve access.

Figure 5.36 Lift buttons located horizontally can be easier to reach.

Figure 5.37 Good use of colour and contrast where the signboard contrasts with its background and the information contrasts with the signboard.

Figure 5.38 Visual contrast incorporated in fittings and finishes can improve access to all toilet facilities.

Figure 5.39 WC compartments fitted for use by ambulant disabled people should always be provided.

Figure 5.40 Good use of contrast ensures that fittings are visible.

Figure 5.41 Projecting signage allows people to identify the position of a toilet from a distance; this is important for people who experience incontinence. This sign shows good use of colour contrast and symbols and, importantly, all the facilities are located in the same area.

Figure 5.42 A clear sign with good use of colour, symbols and text. The RH identifies to a disabled person that this is a right-hand transfer WC. This is very useful information, easily provided.

Figure 5.43 The use of large floor-to-ceiling mirrors can cause confusion and should be avoided.

Figure 5.44 Not all disabled people use accessible toilets; some will use the standard toilet accommodation and so the need for good design, colour contrast and appropriate fittings is also important here. Children should also be considered.

Figure 5.45 Symbols can be useful for many people. Bi-fold doors can be used to avoid obstructing corridors.

Figure 5.46 Counters should allow communication at seated and standing heights. A low counter or low section will allow wheelchair users to communicate with staff or customers. Seats should be provided to both staff and customer side.

Figure 5.47 Ramped access with handrails into this swimming pool is easily provided and will improve access.

Figure 5.48 An induction loop provided at a reception counter will help communication with hearing aid users. The loop should be clearly signed and regularly checked.

Figure 5.49 Visual contrast can help identify critical surfaces and special features. Light reflectance values

should be checked to ensure adequate contrast.

Figure 5.50 Clear text, visual contrast, use of symbols and directional arrows can all improve the effectiveness of signs.

Figure 5.51 The incorrect use of surface finish can completely negate the effectiveness of a sign, especially in certain lighting situations. Non-reflective surface finishes for signs are essential.

Figure 5.52 Signs should be clear and easy to understand. Too many signs can cause confusion. Effective, ongoing management of signage is essential.

Figure 5.53 Good use of text, contrast, symbols and directional arrows, and ideally sized, bearing in mind the distance from which it will be viewed.

Figure 5.54 The projecting section of this sign indicates facilities on this floor of the building. Information in Braille is located on the horizontal surface.

Figure 5.55 Symbols on signs can be useful for many people.

Figure 5.56 A tactile model can be of benefit to people with visual impairments. Information in Braille is also provided and located where it can be reached easily.

Figure 5.57 Strong shadows can cause confusion and make navigation difficult.

Figure 5.58 Window blinds or shading can be used to control natural lighting and prevent strong shadows and glare.

Figure 5.59 Visual contrast should be considered in sign design as well as text size and typeface.

Figure 5.60 Refuges should be clearly identified and a system of communication provided.

Figure 5.61 Fire exit signs should be located where they are clearly visible and care taken to ensure lighting does not cause reflections that obscure the information.

Figure 5.62 The use of powered way-guidance systems will not be appropriate in all buildings in all situations. However, in buildings where there may be a need to evacuate a lot of people such as from cinemas, auditoria, conference venues, and so on, the selective use of such systems can assist considerably in improving the evacuation speed.

Figure 5.63 Assisting disabled people out of the building using a fire exit with external steps presents management issues that simply cannot be addressed by an ad hoc escape policy.

From the endorsements and reviews of previous editions:

I welcome this guidance which should enable people to understand access requirements and to undertake access audits. ... The law is important but how much better if those organisations simply did it right in the first place so the law did not need to be used. This book should help do just that.

Bert Massie, Chairman of Disability Right Commission

Please make the most of what you find in this volume, but please don't use it merely to achieve compliance. Use it to spark creativity, humanity and urbanity in the buildings and public spaces we all use every day, so nobody need feel 'this place isn't for me' and everyone feels welcome.

Richard Simmonds, Chief Executive, CABE

This is a well-written and practical manual, recommended reading for building engineers concerned with the creation, planning and management of buildings.

Building Engineer

Incredibly informative ... will enable you to keep the edge over non-enlightened competitors.

Architectural Technology

This is an excellent book.

Access Journal

Both authors are well known for their work on access ... between them they have produced a useful book that is helpful in the context of our current built environment and what steps can be taken to improve access.

Chartered Architect and Registered Access Consultant

About the Authors

Ann Sawyer BA Dip. Arch. is an architect and access consultant. She works with architects, developers, building owners and facilities managers providing access consultancy services on new and existing buildings and environments. She advises on access and inclusive design, provides access appraisals and audits, advises on improvements to meet new legislative requirements and provides training in accessible design, auditing and the management of accessible environments. She has been involved in many prestigious new build and refurbishment projects for public and private sector clients and has advised on access to a wide variety of historic buildings. Ann is a member of the London Legacy Development Corporation Quality Review Panel, the South East Regional Design Panel and is an Urban Design London design surgeon.

Ann can be contacted at her consultancy practice Access Design on ann@accessdesign.co.uk and for more information about her work and consultancy services, see www.accessdesign.co.uk

Keith Bright is Emeritus Professor of Inclusive Environments at the University of Reading and an independent registered access consultant. He is a member of the Building Regulations Advisory Committee for England (BRAC), with a special interest in inclusive design issues, and a Design Advocate for the Design Commission for Wales. Keith is a Consultant member of the National Register of Access Consultants (NRAC) and the Royal Institution of Chartered Surveyors (RICS) Inclusive Environment Consultants Scheme (IEC). He served as

Chairman of the NRAC Management Board until March 2012. From 2008 to 2014 Keith was a member of the Civic Trust Awards National Panel involved in the allocation of UK and international awards. From 2012 to 2014 he also served as Chairman of the national judging panel of the Selwyn Goldsmith Universal Design Award which is supported by the Civic Trust Awards.

His international roles have included working as an advisor to the Building Construction Authority in Singapore on issues related to Universal Design, and working with the Global Alliance on Accessible Technologies and Environments (GAATES) in the development of an international body for the certification and accreditation of access auditors and consultants.

Foreword

Innovative approaches to design by architects and their clients continue to provide us with buildings and spaces of exceptional quality. What makes a successful building or public space is difficult to encapsulate, but what is often universally demonstrated is a commitment by designers to strive for excellence in terms of aesthetics, environmental performance and inclusive design. The completed project should engage with and have a positive impact on its users. Buildings should of course make a visual statement, but at the Civic Trust Awards, we firmly believe in the concept that architecture and design should be people centred. Inclusive design has been at the forefront of our thinking since the 1990s, and we utilise the services of hundreds of access professionals, working alongside experienced architects, as part of our judging process to ensure this philosophy is maintained.

It is true to say that we still see examples where designers clearly don't fully comprehend the importance of early consultation with respect to accessibility. Inclusive design should not be a bolt-on afterthought, it should be integral to the design process from inception. That way, many issues that would often arise later on can be designed out.

In this book, you will see a number of case studies from the Civic Trust Awards where the client and their architect have appointed an inclusive design consultant or have consulted with a local access group who provide help, advice and guidance throughout the design process. These are the true success stories, where planning, design concept, aesthetics, performance and accessibility are fully integrated.

Not all approaches to design will adopt these same philosophies, but we must continue to strive to help make it become the norm. Inclusive design is not about just meeting minimum standards; it should be about creating an environment that is welcoming and accessible to all users without the need for expensive interventions. Successful design is seamless inclusive design.

Malcolm Hankey BSC LLB IEng MICE Hon FRIBA
Managing Director
Civic Trust Awards

Acknowledgements

I would like to thank all my friends and colleagues who are working to improve the accessibility of buildings and spaces and to promote inclusive design. Since the first edition of this book was published, there has been increased recognition of the importance of providing access for all; it is critical that this is maintained and that inclusive design becomes integral to the design and management of our environment.

Thanks to Vin Goodwin, who supplied some of the photographs, to Keith Bright, whose knowledge and enthusiasm have been invaluable throughout the writing and updating process, and to Joe and Liddy for giving support and inspiration.

Ann Sawyer

I am, as always, indebted to those I worked with in the Research Group for Inclusive Environments at the University of Reading and to the many other experienced and knowledgeable people I have had the pleasure of working with throughout my life. Far too many people to mention individually but you know who you are – and to you all I say a big thank you.

Thanks also to Ann Sawyer who has worked so hard to bring this third edition to fruition, to Amanda Spence at the Design Commission for Wales for your valuable help, and to Carole-Anne Davies, Malcolm and Karen Hankey, Ann Skippers, Jane Simpson, Kath Phipps and Simon Turton for your valued friendship and support.

Keith Bright

About the Website

On the book's companion website at <http://www.wiley.com/go/TheAccessManual>, you will find invaluable resources:

- Photo Gallery - with examples of best practice, what to avoid and reasons why
- Access Audit Checklists - for you to download and use
- Case Study Material - demonstrating good practice
- Sources of Guidance on Legislation, Standards and Good Practice
- Information Sources

Introduction

Buildings are designed for people to use – to give shelter, to house, for work and for play. An environment that is designed to be inclusive allows those activities to take place without restricting access to people with certain abilities only. Inclusive design does not disable the users, it enables independent and equal use.

For many owners, designers and managers of buildings and environments, meeting the needs of all users, and especially disabled people, can seem difficult. However, it is possible to address the needs of the great majority of users with design and management solutions that neither conflict with each other, nor are expensive or difficult to carry out. An inclusive approach requires designers and building managers to consider abilities rather than disabilities and integrate a range of needs into one solution that can be used by everyone. The improvement in accessibility that can result from this approach will benefit all users of the built environment, not just disabled people.

Inclusive design also takes into account the long-term implications of sustainability by providing flexible and responsive developments limiting the need for future adaptation, as well as helping to promote social inclusion. True inclusion goes beyond simply being able to gain access to a building or space. It also allows people to experience designs and management practices that enhance and stimulate mental and physical well-being, reflects the diversity of modern society, encourages mutual relationships and harmony between social groups, and encourages equality in the distribution of economic resources.

Designing inclusively will help those who have duties placed upon them by anti-discrimination legislation such as the Equality Act 2010. Well-designed buildings that meet a broad range of people's needs are more likely to allow occupiers to meet their duties and can also offer employment and commercial benefits.

Objectives of the Manual

This manual covers the design, improvement, maintenance and management of accessible environments. The intention is to encourage designers, owners and managers of buildings to look at how they can provide and operate buildings, services and employment facilities in a way that allows independent and convenient use by everyone.

The manual is intended to enable people with responsibility for the design and management of the built environment to

- be aware the issues involved in accessibility;
- take account of those issues when commissioning and designing new or refurbished developments;
- understand and commission access audits;
- create and manage an access improvement programme;
- maintain accessibility in buildings and working practices; and
- respond effectively to the legal requirements of the Equality Act 2010 and other relevant legislation.

The first chapter looks at inclusive design and what this means in relation to the design of the built environment and gives information on access appraisals, the access statement and access strategy. Chapters [2](#) and [3](#) cover legislation, standards and guidance relating to access.

[Chapter 4](#) explains the audit process and how it fits into an access improvement programme, the implementation of improvements and the importance of ongoing access management to ensure accessibility is sustained in use.

The design criteria in [Chapter 5](#) cover access to and use of buildings considering the needs of a wide range of users. The design guidance can be used when designing new buildings or taken as a standard to assess and improve existing ones.

Appendix A contains a number of sheets of 'general acceptability criteria', which can be used to highlight where access problems exist. Appendix B gives sources of reference and further information. Throughout the manual there are boxes giving hints and tips. The information given in the boxes covers issues that are not always found in standards, legislation or other guidance, and includes advice and thoughts that come from the authors' experience.

Inclusive design is about people and their needs, and, in the context of this manual, how these relate to the design, use and management of the built environment. The manual not only includes comprehensive information on standards, legislation and good practice, but also recognises that to achieve a truly accessible environment, designers and operators of buildings must move beyond compliance with standards and adopt a new way of thinking. Taking a creative approach, considering the needs of everyone, integrating those needs into good, thoughtful designs and practices will help achieve an accessible, inclusive, built environment that enables people to participate fully in all aspects of society.

[Case study - Canada Water Library](#)

An Inclusive Approach

An inclusively designed and managed building or space will allow everyone to maximise their own individual abilities and enjoy full, equal, confident, independent and safe participation in everyday activities. Inclusive design goes beyond simple accessibility. A design that offers a choice of stepped or ramped approach to a building addresses accessibility for all; however, one that incorporates a level approach for everyone to use is a truly inclusive design.

Design guidance is often based on the needs of a notional 'average' person; however, everyone varies from the average in some way. People differ in height, strength and dexterity; can have different visual, hearing or cognitive abilities; or may have respiratory impairments or reduced stamina. Mental health or emotional issues can also affect people's ability to interact with the built environment.

Physical and mental health conditions can be temporary, ongoing or progressive and may vary considerably throughout different stages of life. Older people may have limited mobility; some may use wheelchairs, sticks or crutches. Mobility may be affected by having to carry a child or heavy shopping bags or push a buggy.

Despite this apparently wide diversity of need, many of the issues that affect how people interact with the built environment are similar. For example, good, clear, effective and sensibly used signage incorporating symbols helps everyone, including those whose first language is not that of the information on the sign. Firm, level, non-reflective surfaces will not only benefit people using mobility aids such as a wheelchair or crutches, but also people pushing buggies or carrying luggage. Well-designed lighting, colour and visual contrast may benefit people with sensory or cognitive impairments and will also affect how people feel and are able to respond to spaces and places.

An inclusive approach to design and management does not deny that there are specific areas where particular assistance can be provided. Hearing enhancement systems, such as induction loops, or the provision of information in Braille, are useful to certain building users. Specific provisions that meet particular needs are also part of inclusive design.

Adopting a positive approach and giving careful consideration to the abilities of users, rather than their disabilities or limitations, can identify design outcomes that are able to address the needs of a wide range of building users across the spectrum of ability, age, gender, and religious and cultural diversity. Active and effective management in use will ensure that these identified design expectations will actually be delivered in practice.

Figure 1.1 The London 2012 Olympic Parklands and Public Realm project, which received a Civic Trust award for Recognition of Excellence in the Built Environment, is a good example of inclusive design in practice.

Principles of Inclusive Design

To help achieve this aim, it is useful to understand and adopt the established principles of inclusive design. The Commission for Architecture and the Built Environment (CABE) published guidance on inclusive design, including a set of principles.

CABE was established in 1999 as the UK government's advisors on architecture, urban design and public space in England. It was dissolved in 2011 and subsequently merged with the Design Council.

See Appendix B for details of how to access archived publications from CABE, including those relating to the principles of inclusive design.

In the view of CABE, good design is inclusive design, and design that does not deliver an inclusive environment is not
