The scholarly world is indeed fortunate that Nīlakaṇṭha—an astronomer-mathematician hailing from the Garga lineage and blessed with a clear intellect—composed, among several other works, a treatise called the *Tantrasaṅgraha*, which is considered to be a gem among works [in astronomy], resplendent with a variety of *yuktis*, neither terse nor too elaborate, and which gives far more accurate procedures for solving problems involving eclipses, shadow measurements, [the application of the equation of centre] in the case of Mercury and Venus, and so on.

We are now extremely happy to bring out this treatise, the *Tantrasaṅgraha*, along with translation, annotation and detailed mathematical exposition for the intellectual delight of the scholarly community. We are also immensely pleased to dedicate this work of ours to Mādhava and the galaxy of other astronomers that this great lineage has produced.

Foreword

In the history of mathematics and astronomy in India, the Kerala school which flourished during the fourteenth–seventeenth centuries CE, has a unique position. Mādhava of Saṅgamagrāma, Parameśvara, Nīlakaṇṭha Somayājī, Jyeṣṭhadeva and Śaṅkara Vāriyar were among the luminaries of this school, which made original contributions in mathematics, formulating the infinite series for the trigonometric functions and π , that antedated similar achievements of European mathematicians by a couple of centuries. The origin of calculus also can be traced to this school.

In astronomy too, the Kerala school had significant achievements. The versatile astronomer Nīlakaṇṭha Somayājī (1444-1545) produced several works on astronomy, of which the *Tantrasaṅgraha* (about 430 verses in *anuṣṭubh* metre in eight sections or *prakaraṇas*) is a comprehensive treatise. He introduced in this elegant work a major revision of the traditional Indian planetary model, a detailed geometrical picture of which is discussed in his two small but lucid works—*Siddhāntadarpaṇa* (31 verses) and *Golasāra* (56 verses). According to Nīlakaṇṭha's geometrical picture of planetary motion, the five planets (Mercury, Venus, Mars, Jupiter and Saturn) move in eccentric orbits around the mean Sun, which in turn orbits around the Earth. Such a formulation was put forward by the European (Danish) astronomer Tycho Brahe, nearly a century later. *Tantrasaṅgraha* is also known for its other innovations introduced by Nīlakaṇṭha.

In March 2000, the Department of Theoretical Physics, University of Madras, organized a conference in collaboration with the Indian Institute of Advanced Studies, Shimla, to celebrate the 500th anniversary of *Tantrasaṅgraha*. Though the importance of this text was known to historians of Indian astronomy for quite some time, and several research papers have been published on the original ideas presented in this work, there was a great need for an accurate English translation of this seminal treatise, with detailed notes in modern notation. Profs K. Ramasubramanian and M. S. Sriram, who have the linguistic and subject expertise, have fulfilled this need admirably. As may be noted from

the current volume, every attempt has been made by the authors to make the work as self-contained as possible by giving detailed explanations as well as several explanatory appendices besides a glossary and bibliography. Historians of astronomy, both Indian and foreign, are most grateful indeed to them for their devoted efforts in bringing out this publication.

The authors are already well known for their studies and publications in the area of Indian mathematics and astronomy. Together with another savant, M. D. Srinivas of the Centre for Policy Studies, Chennai, they were involved in preparing a detailed explanatory notes for *Gaṇita-yuktibhāṣā* of Jyeṣṭhadeva, which was published in two volumes by the Hindustan Book Agency, New Delhi with a critical edition of the text and English translation by K. V. Sarma, an eminent scholar who published several works on Indian astronomy. A reprint of this work was also brought out recently by Springer, the noted international publishers, to make it available for the international readership. In fact, Jyeṣṭhadeva, who was a junior contemporary of Nīlakaṇṭha, at the commencement of his work states that his aim in composing the work is to explain the calculational procedures given in *Tantrasaṅgraha*. It is but fitting, therefore, that Profs Ramasubramanian and Sriram, who were involved with the production of explanatory notes of *Gaṇita-yuktibhāṣā*, are the authors of the present volume on *Tantrasaṅgraha*.

The Hindustan Book Agency has been rendering yeoman service to scholars interested in the history of mathematics, by bringing out several volumes in its series 'Culture and History of Mathematics'. I am happy that in collaboration with Springer it is publishing the present work on *Tantrasaṅgraha*, which, I am sure, will be of great value to historians of science in general and of astronomy in particular. It is my fond hope that several other timeless works of this type will emerge from the pens of these erudite authors in future.

History and Philosophy of Science

Preface to the revised and expanded edition

The first edition of this book, published jointly by the Hindustan Book Agency (HBA) and Springer in 2011, received an overwhelmingly positive response from readers and scholars alike. Its encouraging reception underscored the book's value in advancing discussions in its field. However, with the first edition having been out of print for the past few years, there has been a growing demand for its rerelease. To meet this demand, we are delighted to present the second (revised and expanded) edition. In this edition, we have included necessary updates and also expanded coverage in select sections from the original edition.

As indicated in the preface to the first edition, the traditional Indian planetary model's modification by Nīlakaṇṭha in the *Tantrasaṅgraha* initially drew our attention to the work. However, this topic is only briefly addressed in the text, as it primarily serves as a *tantra* text focused on computational algorithms. Fortunately, Nīlakaṇṭha has explored his model in greater depth, along with a detailed geometrical depiction of planetary motion, in his other works. According to his geometrical framework, the planets follow eccentric orbits around the Sun, which, in turn, orbits the Earth. This quasi-heliocentric model closely resembles the one proposed by Tycho Brahe in the late 16th century, albeit derived from entirely different considerations.

In collaboration with M. D. Srinivas, we conducted a detailed analysis of this model and published our findings in the Indian journal *Current Science* in 1994. Since then, we have revisited and deepened our understanding of the subject. Appendix F, co-authored with M. D. Srinivas, offers an updated perspective on the traditional Indian planetary model and its revision by Nīlakaṇṭha.

Beyond the planetary model, the work introduces several significant innovations in mathematical techniques, including accurate sine table computations, the use of series expansions for sine and cosine functions, and a systematic approach to solving spherical astronomical problems.

It was noted that the first edition contained a few typographical errors, and some of the explanatory notes required editing for improved clarity. Additionally, some figures needed revision for better comprehensibility. All these aspects

have been addressed in this edition. While no major changes have been made to the content, there are notable updates to the style and format. In this edition, the typesetting of *Devanāgarī* has been done with the use of Śobhikā fonts, and all diagrams have been redrawn using the ‘tikz’ package. These improvements have significantly enhanced the overall presentation and visual quality of the work.

In the preparation of the revised edition, we received immense help from some of the project staff and research scholars working at the Cell for Indian Science and Technology in Sanskrit (CISTS), IIT Bombay. The help received was both in terms of proof-reading as well as redrawing all the diagrams using the ‘tikz’ package. In particular, we would like to acknowledge Mandadi Varuneshwar Reddy, Sreelekshmy C. J. and Ashwini Devaraj. The countless hours they would have spent in the process of getting this revised edition by meticulously working on the earlier volume is deeply appreciated. We would also like to record our gratitude to all those involved in making funds available to support the project staff through the Science and Heritage Initiative (SandHI) at IIT Bombay. Our special thanks go to Jainendra Jain and Devendra Jain of the HBA, New Delhi, for publishing the first edition of this work in collaboration with Springer, London, and urging us to prepare the current edition. Though HBA requested us to submit the manuscript more than a couple of years ago, there has been significant delay from our part. We deeply appreciate their patience in bearing with us the extraordinary delay on our part.

Chennai*

Preface to the first edition

Tantrasaṅgraha composed in 1500 CE by the Kerala astronomer Nīlakaṇṭha Somayājī, has long been recognized as an important Indian text in astronomy. It is a comprehensive text which discusses all aspects of mathematical astronomy such as the computation of the longitudes and latitudes of planets, various diurnal problems, the determination of time, eclipses, the visibility of planets etc. There are two critical editions of the Sanskrit text, by S. K. Pillai in 1958 and K. V. Sarma in 1977, which between them include the commentaries *Laghu-vivṛti* in prose for the entire text, and *Yukti-dīpikā* in verses for the first four chapters, both of which are composed by Śaṅkara Vāriyar. The need has long been felt for an English translation of the work, with detailed explanatory notes in modern notation, so that the work is accessible to a larger audience. It is with this objective that we began a project on *Tantrasaṅgraha*, funded by the Indian National Science Academy (INSA), in 2000.

Meanwhile, along with M. D. Srinivas (Centre for Policy Studies, Chennai), we were involved in preparing detailed explanatory notes for *Gaṇita-yukti-bhāṣa* (GYB) of Jyeṣṭhadeva, edited and translated by K. V. Sarma, and published in 2008 by the Hindustan Book Agency and reprinted in 2009 by Springer. Though the work on GYB caused delay in the publication of the present work, it was very rewarding as GYB gives detailed explanations of most of the algorithms in *Tantrasaṅgraha*, and provides valuable insights on many topics covered in that work.

Scholars in the area of the history of astronomy in general, and Indian astronomy in particular, form the natural readership for this work. However, keeping the larger readership—anyone wanting to know the methods of Indian astronomy—in mind, we have attempted to make it as self-contained as possible, so that any motivated person with a sound background in mathematics at the final school (+2, as it is termed in India) level and interested in spherical astronomy will find it useful. We have also included a glossary of frequently occurring Sanskrit terms and several appendices that should serve to clarify many concepts relevant to the topics in the main text.

The modification of the traditional Indian planetary model by Nīlakaṇṭha in *Tantrasaṅgraha* is what attracted us to the work initially. But this topic is dealt with all too briefly in it, as it is a *Tantra* text devoted mainly to computational algorithms. However, Nīlakaṇṭha has discussed his model extensively, along with his geometrical picture of planetary motion, in other works. In collaboration with M. D. Srinivas, we had made an incisive study of this model and published a paper on it in the Indian journal *Current Science* way back in 1994. Since then we have had occasions to study this in more detail. Appendix F, on the traditional Indian planetary model and its revision by Nīlakaṇṭha Somayājī, of which M. D. Srinivas is a co-author, reflects our current understanding on this subject.

We are deeply indebted to Prof. M. D. Srinivas—our collaborator on the different aspects of studies on Indian astronomy and mathematics that we have been doing for almost two decades now—for meticulously going through the entire manuscript and offering several valuable suggestions. We would also like to acknowledge the suggestions given by the two anonymous referees for improving the manuscript. We are grateful to (the late) Prof. K. V. Sarma with whom we have had an extensive collaboration, especially during the preparation of *Yuktibhāṣā*, and who has been a source of great inspiration for us. We would like to thank Profs C. S. Seshadri and R. Sridharan of the Chennai Mathematical Institute for their continued support and encouragement. Our special thanks go to Prof. B. V. Subbarayappa, Bangalore, the doyen of the history of science in India, for having readily agreed to write the Foreword to this work.

Our heart-felt thanks are due also to Profs S. Balachandra Rao of Bangalore, and V. Srinivasan of Hyderabad (currently with the University of Madras) for their constant and vociferous support to us over all the years in all our work on Indian astronomy. We also thank Profs P. M. Mathews, G. Bhamati, M. Seetharaman, S. S. Vasan, K. Raghunathan, A. S. Vytheeswaran, R. Radhakrishnan, and Dr Sekhar Raghavan associated with the Department of Theoretical Physics, University of Madras, for their kind and active interest in our work over the years. We would like to acknowledge the keen interest expressed by Swami Atmapriyananda, Belur Math, in promoting studies in Indian astronomy and mathematics. We are indeed grateful to Profs David Mumford of Brown University and Manjul Bhargava of Princeton University for their kind encouragement and enthusiastic support. It is a pleasure to thank Profs S. M. R. Ansari, A. K. Bag, Jitendra Bajaj, V. Balakrishnan, A. V. Balasubramanian, Rajendra Bhatia, S. G. Dani, Sinniruddha Dash, Amartya Datta, P. C. Deshmukh, P. P. Divakaran, Raghavendra Gadagkar, George Joseph, Rajesh Kocchar, S. Madhavan, Madhukar Mallayya, N. Mukunda, Roddam Narasimha, M. G. Narasimhan, Jayant Narlikar, C. K. Raju, Sundar Sarukkai, B. S. Shylaja, Navjyoti Singh, S. P. Suresh, T. Trivikraman, Mayank Vahia, Padmaja Venugopal and K. Vijayalakshmi, as well as Profs Mohammad Bagheri, Subhash Kak, Agathe Keller, Francois Patte, Kim Plofker,

T. R. N. Rao, S. R. Sarma and Michio Yano for their kind interest in our work in Indian astronomy and mathematics in general, and this work in particular.

One of the authors (Ramasubramanian) would like to acknowledge the unstinting support and encouragement received from the former Director of IIT Bombay, Prof. Ashok Misra, and other IIT Bombay fraternity members, particularly Profs. S. D. Agashe, Rangan Banerjee, Jayadeva Bhat, S. M. Bhawe, Amitabha Gupta, Devang Khakhar, Malhar Kulkarni, Ravi Kulkarni, H. Narayanan, Prabhu Ramachandran, Krithi Ramamritham, H. S. Shankar, G. Sivakumar, A. K. Suresh, Sivaramakrishnan and Jugal Verma. Special thanks are also due to K. Mahesh, U. K. V. Sarma, R. Venketeswara Pai, Dinesh Mohan Joshi and Vanishri Bhat for their devoted assistance at different stages of the preparation of the manuscript. In fact, we are particularly indebted to Vanishri for spending countless hours in setting a uniform style for all the figures that appear in the book and U. K. V. Sarma for carefully proof reading the entire text.

This work is the outcome of a project sanctioned by INSA, New Delhi, during October 2000–March 2004. We would also like to place on record our gratitude to the Sir Dorabji Tata Trust and the National Academy of Sciences, India, for their financial assistance by way of projects, which was extremely useful in offering fellowship to the project staff as well as in the production of the manuscript in a camera-ready form. We are deeply indebted to INSA for the financial support as well as for readily granting the permission to publish the work. Our special thanks go to Jainendra Jain and Devendra Jain of the Hindustan Book Agency, New Delhi, for graciously coming forward to publish this work in collaboration with Springer, London.

Finally, the authors are grateful to the copy-editor(s) for going through the manuscript meticulously, and making valuable comments and suggestions.

Preface to the revised edition	ix
Preface to the first edition	xi
1 मध्यमप्रकरणम्	
Mean longitudes of planets	1
1.1 Invocation	1
1.2 Measurement of civil and sidereal day	4
1.3 Measurement of smaller units of time	8
1.4 Lunar reckoning of time	11
1.5 Solar reckoning of time	15
1.6 Definition of an intercalary month	18
1.7 Nature of the intercalary month	23
1.8 Days of the God etc.	25
1.9 Number of revolutions of planets in a <i>Mahāyuga</i>	25
1.10 Number of civil days in a <i>Mahāyuga</i> etc.	28
1.11 Finding the number of days elapsed since an epoch	32
1.12 Finding the mean positions from <i>Ahargana</i>	39
1.13 Correction due to difference in longitude.....	41
1.14 Duration corresponding to difference in longitude	43
1.15 Initial positions at the beginning of the <i>Kaliyuga</i>	46
1.16 Introducing an alternative <i>yuga</i>	48
1.17 The <i>Mandoccas</i> at the beginning of the <i>Kaliyuga</i>	49
2 स्फुटप्रकरणम्	
True longitudes of planets	51
2.1 Definition of the anomaly and the quadrant	51
2.2 Computation of the Rsines and the arcs	56
2.3 Computation of the tabular Rsines	58
2.4 Another method for obtaining the Rsines	62
2.5 Obtaining the desired Rsines and Rcosines	66
2.6 Determining the length of the arc from the corresponding Rsine	71
2.7 Finding more accurate values of the desired Rsine	74
2.8 Computation of the Rsine value of a small arc.....	77
2.9 Computation of the desired Rsine	78

2.10	True longitude of the Sun	79
2.11	Prāṇās of the ascensional difference	80
2.12	Planets at sunrise at observer's location	85
2.13	Durations of the day and the night	88
2.14	Obtaining the true Moon	94
2.15	Finding the arc corresponding to cara etc.	95
2.16	Obtaining the manda and śighra hypotenuses	102
2.17	Obtaining the iterated hypotenuse	107
2.18	Another method of obtaining the iterated hypotenuse	110
2.19	Correcting the Sun using the iterated hypotenuse	113
2.20	Obtaining the mean Sun from the true Sun	114
2.21	Another method for getting the mean planet	119
2.22	Another method for getting the manda -hypotenuse	121
2.23	Instantaneous velocity of a planet	121
2.24	Finding Nakṣatra and Tithi	123
2.25	The scheme of correction for the planets	126
2.26	The correction for Mars, Jupiter and Saturn	126
2.27	The correction for Mercury	132
2.28	The correction for Venus	135
2.29	The daily motion of the planets	137

3 छायाप्रकरणम्

	Gnomonic shadow	139
3.1	Positioning the gnomon	139
3.2	Finding the East–West points	142
3.3	Correcting the East–West points	142
3.4	Fixing the directions in one's own place	146
3.5	Equinoctial shadow	148
3.6	Relation between the gnomon, its shadow and the hypotenuse	150
3.7	Rsine and Rcosine of the latitude	151
3.8	More accurate values of the latitude	153
3.9	The prime vertical, the celestial equator and the amplitude at rising	161
3.10	The rising time of rāśis	163
3.11	Big gnomon and the gnomonic shadow	171
3.12	Correction in finding the shadow	174
3.13	Time elapsed or to be elapsed from the mahāśaṅku	178
3.14	True Sun from the shadow of the gnomon	181
3.15	Motion of equinoxes	183
3.16	Latitude from zenith distance and declination	186
3.17	Directions from the shadow of the gnomon	186
3.18	Locus of the tip of the shadow of the gnomon	190
3.19	Another method for finding the Rsine of the shadow	197
3.20	Gnomon when the Sun is on the prime vertical	201
3.21	True longitude of the Sun from the samaśaṅku	204

3.22	Hypotenuse of the shadow from <i>samaśaṅku</i>	205
3.23	Hypotenuse by a different method	207
3.24	<i>Gataiṣyaprāṇa</i> from <i>samamaṇḍala-śaṅku</i>	208
3.25	Hour angle from the <i>samamaṇḍala-śaṅku</i>	210
3.26	Hour angle by another method	210
3.27	<i>Kṣitijyā</i> from the <i>samamaṇḍala-śaṅku</i>	211
3.28	The ten problems	213
3.29	Determination of z and H from δ , a and ϕ	215
3.30	Determination of z and δ from H , a and ϕ	225
3.31	Determination of z and a from H , δ and ϕ	231
3.32	Determination of z and ϕ from H , δ and a	232
3.33	Determination of H and δ from z , a and ϕ	235
3.34	Determination of H and a from z , δ and ϕ	236
3.35	Determination of H and ϕ from z , δ and a	238
3.36	Determination of δ and a from z , H and ϕ	240
3.37	Determination of δ and ϕ and a and ϕ from the rest	243
3.38	Shadow along any direction	244
3.39	Shadow when the amplitude is 45 degrees	248
3.40	Obtaining the orient ecliptic point	253
3.41	Inaccuracy in determining the <i>prāglagna</i>	256
3.42	Determination of the <i>kālalagna</i>	256
3.43	Zenith distance of the <i>vitribhalagna</i>	259
3.44	Exact <i>udaya</i> and <i>asta-lagnas</i>	262
3.45	Determination of the <i>madhyalagna</i>	265
3.46	Determining the <i>madhyalagna</i> without iteration	269
4	चन्द्रग्रहणप्रकरणम्	
	Lunar eclipse	271
4.1	Time of conjunction of the Moon and the Earth's shadow	271
4.2	Exact moment of conjunction by iteration	274
4.3	Radii of the orbits of the Sun and the Moon	276
4.4	Radii of the Sun, Moon and the Earth in <i>yojanas</i>	277
4.5	Actual distances of the Sun and the Moon in <i>yojanas</i>	278
4.6	Second approximation to the radii of the orbits	279
4.7	Angular diameters of the Sun and the Moon	282
4.8	Length of the Earth's shadow	283
4.9	Angular diameter of the Earth's shadow in minutes	284
4.10	Moon's latitude and true daily motion	286
4.11	The occurrence and non-occurrence of an eclipse	287
4.12	The condition for the occurrence of a total eclipse	289
4.13	The time of half-duration, the first and the last contact	290
4.14	Iteration for obtaining the half duration	292
4.15	The time of the first and the last contact	293
4.16	The visibility of the first and the last contact	298
4.17	The visibility or otherwise of <i>sparsā</i> and <i>mokṣa</i>	299

4.18	Accurate distance of separation between the orbs	309
4.19	State of the eclipse being invisible	316
4.20	Shift of the instant of maximum obscuration from opposition	316
4.21	Deflection due to latitude and that due to declination	317
4.22	Graphical representation of the eclipse	322
5	रविग्रहणप्रकरणम्	
	Solar eclipse	325
5.1	The possibility or otherwise of <i>lambana</i> and <i>nati</i>	325
5.2	Finding the <i>drkkṣepa</i> and the <i>drḡgati</i>	329
5.3	Parallax in longitude and its application for finding the instant of conjunction	332
5.4	Parallax in latitude of the Sun in minutes	336
5.5	Parallax in latitude of the Moon in minutes	337
5.6	The possibility of a solar eclipse	341
5.7	Application of <i>lambana</i> in finding the half-duration	343
5.8	Time of <i>sparsā</i> by an iterative process	348
5.9	Time of <i>mokṣa</i> by an iterative process	351
5.10	Half-duration of obscuration, etc.	353
5.11	The <i>drkkarṇa</i> of the Sun	355
5.12	The <i>drkkarṇa</i> of the Moon	358
5.13	Transformation to <i>drḡgola</i>	363
5.14	Determination of the middle of the eclipse	369
5.15	Distance of separation between the Sun and the Moon	372
5.16	Announcement of the visibility of the eclipse	373
5.17	Graphical representation of the eclipse	377
6	व्यतीपातप्रकरणम्	
	Vyatīpāta	381
6.1	The possibility of <i>vyatīpāta</i>	381
6.2	Finding the declination of the Sun and the Moon	383
6.3	Speciality in the determination of the Moon's declination	383
6.4	Declination of the Moon by another method	386
6.5	The occurrence or non-occurrence of <i>vyatīpāta</i>	394
6.6	The criterion for the non-occurrence of <i>vyatīpāta</i>	396
6.7	Determining if <i>vyatīpāta</i> has occurred	402
6.8	The middle of <i>vyatīpāta</i>	407
6.9	The beginning and the end of <i>vyatīpāta</i>	407
6.10	Inauspiciousness of the later half of <i>viṣkambhayoga</i> and others	409
6.11	Inauspiciousness of the three <i>vyatīpātas</i>	410
7	दृक्कर्मप्रकरणम्	
	Reduction to observation	411
7.1	The <i>ākṣa</i> and <i>āyana</i> corrections	411
7.2	The desired latitude of the planets	417

7.3	Reduction to observation of the true planets	421
7.4	Alternate method for reduction to observation	421

List of Figures

1	The five quantities involved in the ‘Ten Problems’.	xli
2	The actual distance of the celestial object from the observer. . . .	xliv
1.1	The diurnal motion of a celestial object (the Sun).	5
1.2	The eastward motion of the Sun in the background of stars.	5
1.3	Lunar month consisting of bright and dark fortnights.	12
1.4a	The <i>rāśi</i> division of the ecliptic, with markings of <i>sāyana-rāśi</i> . . .	16
1.4b	The <i>rāśi</i> division of the ecliptic, with markings of <i>nirayana-rāśi</i> . .	17
1.5	<i>Uttarāyana</i> and <i>Dakṣiṇāyana</i>	17
1.6	A normal lunar year consisting of 12 lunar months.	19
1.7	A lunar year including an <i>adhikamāsa</i>	21
1.8	A lunar year including a <i>samsarpa</i> and an <i>aṃhaspati</i>	22
1.9	<i>Deśāntara-saṃskāra</i> to find the longitude of a planet at sunrise at one’s own place.	44
2.1a	<i>Bāhu</i> and <i>cāpa</i>	53
2.1b	<i>Bāhu</i> and <i>koṭi</i> when the <i>kendra</i> is in different quadrants.	54
2.2	Determination of the <i>ḥyā</i> corresponding to the arc lengths which are multiples of 225’.	57
2.3	Finding the <i>ḥyā</i> value corresponding to a desired arc.	68
2.4	Relation between the <i>dorḥyā</i> , the <i>koṭiḥyā</i> and the <i>triḥyā</i>	71
2.5a	Determination of the arc length corresponding to a given <i>ḥyā</i> . . .	72
2.5b	Geometrical construction to determine the arc length corresponding to a given <i>ḥyā</i>	73
2.6a	Determination of the <i>ḥyā</i> corresponding to the sum or difference of two arcs.	75
2.6b	Geometrical construction to understand the expression for the <i>lambda</i> given in Chapter 2, verse 16.	76
2.7	Determination of the declination and right ascension of the Sun on any particular day.	82
2.8a	The star <i>X</i> , Sun <i>S</i> and the Moon <i>M</i> at sunrise on a particular day.	90

2.8 <i>b</i>	The star X , Sun S' and the Moon M' exactly after one sidereal day.	91
2.9	Shadow of <i>śaṅku</i> on an equinoctial day.	93
2.10	Determination of <i>caraprāṇa</i> for planets.	94
2.11	Finding the arc length of a given <i>ḡyā</i> when it is very small.	97
2.12 <i>a</i>	Obtaining the <i>manda-karṇa</i> in the epicycle model.	103
2.12 <i>b</i>	Obtaining the <i>manda-karṇa</i> in the eccentric model.	105
2.12 <i>c</i>	Variation of the epicycle with the <i>karṇa</i> in the <i>manda</i> process and the <i>aviśiṣṭa-manda-karṇa</i>	109
2.13 <i>a</i>	Determination of the <i>vīparītakarṇa</i> when the <i>kendra</i> is in the first quadrant.	111
2.13 <i>b</i>	Determination of the <i>vīparītakarṇa</i> when the <i>kendra</i> is in the third quadrant.	112
2.14 <i>a</i>	The true position of the planet from the <i>ucca</i> and <i>nīca</i>	114
2.14 <i>b</i>	Obtaining the <i>madhyama</i> (mean position) from the <i>sphuṭa</i> (true position).	116
2.15	Obtaining the <i>sphuṭagraha</i> (geocentric longitude) from the <i>mandasphuṭagraha</i> (true heliocentric longitude) in the case of exterior planets.	129
2.16	Obtaining the <i>sphuṭagraha</i> (the geocentric longitude) from the <i>mandasphuṭagraha</i> (the true heliocentric longitude) in the case of interior planets.	133
3.1	Celestial sphere for an equatorial observer.	141
3.2 <i>a</i>	Fixing the directions through shadow measurements.	143
3.2 <i>b</i>	Relation between the zenith distance of the Sun and the length of the shadow cast by a <i>śaṅku</i>	144
3.3 <i>a</i>	Construction of <i>matsyas</i> for the determination of the cardinal directions.	147
3.3 <i>b</i>	Contrivance used as a plumb-line to determine the perpendicular to the horizon at the observer's location.	148
3.4	Determination of the latitude from the equinoctial shadow of the <i>śaṅku</i>	151
3.5 <i>a</i>	The effect of parallax on the measurement of the latitude of the observer.	154
3.5 <i>b</i>	Sectional view of the Sun and the shadow of the <i>śaṅku</i> generated by it.	156
3.6	The shadow of the two <i>śaṅkus</i> , one imagined to be from the centre to the surface of the Earth and the other at its centre.	159
3.7	The two <i>śaṅkus</i> , <i>OA</i> (actual) and <i>OB</i> (imaginary), drawn to explain the effect of an extended source of light on the shadow generated by the <i>śaṅku</i>	161
3.8	Schematic representation of the <i>śaṅku</i> , the <i>unmaṇḍala</i> and the <i>agrā</i>	162
3.9	Obtaining the right ascension α in terms of the declination δ and the longitude λ	165

3.10a	Duration of rising of the first three <i>rāśis</i> for observers with non-zero latitude.	167
3.10b	Duration of rising of the three <i>rāśis</i> in the second set.	168
3.11	The diurnal path of the Sun with a northern declination δ	172
3.12	Concept of the <i>mahāśaṅku</i> and the <i>mahācchāyā</i>	177
3.13	The zenith distance of the Sun during meridian transit.	182
3.14	The equinoctial and the solstitial points (<i>ayanāntas</i>).	184
3.15	<i>Arkāgrā</i> at sunset when the Sun has northerly declination: (a) as seen on the celestial sphere, (b) as seen in the plane of the horizon.	188
3.16	Determination of the <i>chāyābhujā</i> from the <i>śaṅkucchāyā</i>	189
3.17	The path traced by the tip of the shadow of the <i>śaṅku</i> on any day.	191
3.18	The locus traced by the tip of the shadow.	193
3.19	To show that the curve traced by the tip of the shadow is a hyperbola.	195
3.20	The different hyperbolas obtained with the change in the declination of the Sun.	197
3.21a	<i>Śaṅkuvagrā</i> when the declination is north (+ve) and $A > 90^\circ$	198
3.21b	<i>Śaṅkuvagrā</i> when the declination is north (+ve) and $A < 90^\circ$	200
3.21c	<i>Śaṅkuvagrā</i> when the declination is south (–ve).	200
3.22	Computation of the <i>samamaṇḍala-śaṅku</i>	202
3.23	Length of the hypotenuse in terms of the <i>samamaṇḍala-śaṅku</i>	206
3.24	Determination of the time taken by the Sun to reach the prime vertical from its rise at the observer's location.	209
3.25	Determination of the <i>kṣitijyā</i> from the <i>samamaṇḍala-śaṅku</i>	212
3.26	Celestial sphere with markings of the five quantities, namely <i>śaṅku</i> , <i>nata</i> , <i>krānti</i> , <i>digagrā</i> and <i>akṣa</i> , associated with the <i>daśapraśnāḥ</i>	215
3.27	Triangles used for arriving at the formula for the <i>śaṅku</i> ($R\cos z$) and the <i>nata</i> ($R\sin H$) in terms of the <i>krānti</i> (δ), <i>digagrā</i> (a) and <i>akṣa</i> (ϕ).	218
3.28	Spherical triangle used for arriving at the formula for the <i>śaṅku</i> ($R\cos z$) and the <i>apakrama</i> ($R\sin \delta$), in terms of the <i>nata</i> (H), <i>āśāgrā</i> (a) and <i>akṣa</i> (ϕ).	228
3.29	Celestial sphere, and a sectional view of it to define the <i>chāyākoṭi</i> or <i>bhākoṭi</i>	230
3.30	The positions of the Sun towards the north and south of the prime vertical.	235
3.31	Two triangles having the same hypotenuse defined while giving the expression for the <i>prabhāmcchāyā</i> corresponding to the <i>koṇaśaṅku</i>	249
3.32	Two different positions of the Sun (when $\delta > 0$), corresponding to which there is a possibility of a second <i>koṇaśaṅku</i> and <i>koṇacchāyā</i>	250
3.33	Determination of the <i>prāglagna</i> (orient ecliptic point): approximate method.	255

3.34	Determination of the <i>kālalagna</i> when the Sun lies in the I and the II quadrants.	257
3.35	Determination of the <i>kālalagna</i> when the Sun lies in the third and the fourth quadrants.	258
3.36	Determination of the zenith distance of the <i>vitribhalagna</i>	260
3.37	Determination of the <i>prāglagna</i> (orient ecliptic point)—exact method.	264
3.38	Determination of the <i>madhyalagna</i> (meridian ecliptic point)—iterative method.	266
4.1a	Schematic representation of the situation of the Moon's orbit with respect to the ecliptic.	272
4.1b	Determination of the instant of conjunction.	273
4.2a	Computation of the <i>dvitīya-sphuṭa-karṇa</i> in a lunar eclipse.	281
4.2b	Computation of the <i>dvitīya-sphuṭa-karṇa</i> in a solar eclipse.	281
4.3	Determination of the length of the Earth's shadow.	283
4.4	Determination of the angular diameter of the Earth's shadow. ...	285
4.5	Correction to the latitude and daily motion of the Moon.	287
4.6	The Earth's shadow and the Moon when there is (a) no lunar eclipse, (b) a total lunar eclipse and (c) a partial lunar eclipse. ...	288
4.7	First and the second half-durations of a lunar eclipse.	291
4.8a	Determination of the <i>paramagrāsakāla</i> from the instant of opposition obtained through an iterative process.	296
4.8b	Expression for the time difference between the <i>paramagrāsakāla</i> and the instant of opposition.	297
4.9	Schematic sketch of the celestial sphere, when the first contact in a lunar eclipse is close to the sunrise time.	301
4.10a	Projection of the sum of the semi-diameters <i>samparkārdha</i> (<i>OX</i>) on the vertical circle during the first contact in a lunar eclipse when both the vertical and the <i>samparkārdha</i> are in the same direction.	302
4.10b	Projection of the <i>samparkārdha</i> (<i>OX</i>) on the vertical circle during the first contact in a lunar eclipse when the vertical and the <i>samparkārdha</i> have different directions.	303
4.11	Correspondence between the segment (<i>BO</i>) along the vertical circle and the segment (<i>CO</i>) along the diurnal circle.	304
4.12	Criterion for the visibility of first contact: (a) ignoring the effect of parallax; (b) including the effect of parallax.	307
4.13	Projection of the <i>samparkārdha</i> along the vertical when $\zeta = \theta + z_v$ is greater than 90 degrees.	308
4.14	Criterion for the visibility of last contact considering the effect of parallax.	308
4.15	Formula for finding the distance of separation between the centres of the <i>chāyā</i> and the Moon.	311
4.16a	The Rsine of an arc when the arc itself is small.	315

4.16b	Finding the portion of the Moon obscured at any instant of time during the eclipse.	315
4.17	Schematic sketch to illustrate that the instant of opposition could be different from the <i>paramagrāsakāla</i>	317
4.18	Determination of the <i>akṣavalana</i> and the <i>āyanavalana</i> . The ecliptic and its secondary through the centre of the <i>chāyā</i> (shadow) are denoted by solid lines, whereas the equator and the meridian passing through the Moon are denoted by dashed lines. .	319
4.19	Application of the sum of or the difference between the <i>akṣavalana</i> and the <i>āyanavalana</i>	321
4.20	Graphical representation of a lunar eclipse based on the calculation of the difference between the <i>akṣavalana</i> and the <i>āyanavalana</i>	323
5.1	Parallaxes in longitude and latitude.	326
5.2a	Condition for the absence of <i>lambana</i> (parallax in longitude).	327
5.2b	Condition for the absence of parallax in latitude.	328
5.3	Determination of the Rcosine of the zenith distance of the <i>vitribhalagna</i> called the <i>drkkṣepa</i>	330
5.4	Effect of parallax in longitude.	334
5.5	The effect of parallax in the measurement of the Moon's latitude in a solar eclipse.	339
5.6	The total deflection of the Moon from the ecliptic: (a) when the <i>vikṣepa</i> and the parallax in latitude have the same direction; (b) when the <i>vikṣepa</i> and the parallax in latitude have opposite directions.	340
5.7	The effective deflection from the ecliptic: (a) n_s to the South and n_t to the North; (b) n_s and n_t having the same direction. The dashed and the dotted lines represent the secondary to the ecliptic through the Sun and the Moon respectively.	341
5.8	The direction of the effective deflection from the ecliptic when n_s and n_t have the same direction, but $n_s > n_t$	342
5.9	The Sun and the Moon in the case of (a) no eclipse (b) a partial solar eclipse. While the amber shaded portion represents the Sun's disc, the gray shaded one represents that of the Moon.	343
5.10	The first contact, the middle and the last contact of a solar eclipse occurring in the eastern hemisphere.	345
5.11	The first contact, the middle and the last contact of a solar eclipse occurring in the western hemisphere.	347
5.12	The first contact and the middle of a solar eclipse occurring in different hemispheres.	347
5.13	The Sun and the Moon in the case of (a) a total solar eclipse and (b) an annular eclipse.	354
5.14	Spherical triangle considered to find the distance of the Sun from the observer.	357

5.15	The sum of or difference between the <i>ḍṛkkṣepa</i> and the <i>vikṣepa</i> of the Moon, called the <i>nati</i> , which is used in finding the distance of the Moon from the observer on the surface of the Earth.	359
5.16	Spherical triangle considered in order to find the <i>śaṅku</i> of the Moon, that is used in finding the distance of the Moon from the observer on the surface of the Earth.	361
5.17	The angular diameter of the Moon as seen by an observer on the surface of the Earth.	365
5.18	The latitude of the Moon as seen by an observer on the surface of the Earth.	366
5.19	The parallax of the Moon and the Sun.	367
5.20	The effective deflection from the ecliptic in a solar eclipse.	369
5.21	(a) Parallax in the longitude of the Moon as seen by the observer at the centre of the <i>ḍṛggola</i> . (b) Spherical triangle formed by the pole of the ecliptic, the zenith and the Moon.	371
5.22	Distance of separation between the centres of the Sun and the Moon's discs.	373
5.23	Criteria for the visibility of the totality/annularity of a solar eclipse.	375
5.24	Condition for the visibility of the totality/annularity.	376
5.25	Graphical representation of a solar eclipse. The solar and lunar discs are drawn with <i>A</i> and <i>X</i> as centres. The gray shaded portion is the eclipsed part of the Sun.	379
6.1	Positions of the Sun and the Moon during <i>vyatīpāta</i>	382
6.2a	Finding the declinations of the Sun and the Moon.	384
6.2b	Determination of the true declination of the Moon.	385
6.3a	Determination of the <i>parā-krānti</i> , the greatest declination that can be attained by the Moon at a given point in time.	390
6.3b	Determination of the <i>parā-krānti</i> , when the Moon's orbit is situated between the equator and the ecliptic.	392
6.3c	Determination of the <i>iṣṭa-krānti</i> , the actual declination of the Moon at a given point in time.	393
6.4	Criterion for the occurrence of <i>vyatīpāta</i>	395
6.5a	Moon's orbit having the maximum inclination, $I = \varepsilon + i$, with the ecliptic.	398
6.5b	Moon's orbit having the minimum inclination, $I = \varepsilon - i$, with the ecliptic.	399
6.6	Schematic sketch of the Moon's orbit and the ecliptic, when the maximum inclination of the Moon's orbit, I , is greater than ε	401
6.7	Positions of the Sun and the Moon before <i>vyatīpāta</i> , at the instant of <i>vyatīpāta</i> and after <i>vyatīpāta</i>	404
7.1a	<i>Ākṣa</i> - and <i>āyana-ḍṛkkarmas</i> when the latitude and the declination both have the same direction (both are positive). ...	413

7.1 <i>b</i>	<i>Ākṣa-drkkarma</i> and <i>āyana-drkkarmas</i> when the latitude and the declination both have different directions (one positive and the other negative).....	416
7.2 <i>a</i>	Heliocentric latitude of the planet.	419
7.2 <i>b</i>	Obtaining the geocentric latitude of a planet from its heliocentric latitude.	419
7.3	Expression for the <i>drkkarma</i> correction.....	422
7.4	Minimum angular separation for the visibility of a planet.	424
7.5	Rising and setting of an exterior planet.	426
7.6	Rising and setting of an interior planet in retrograde motion.	426
7.7	Rising and setting of the Moon and the interior planet in its direct motion.	427
8.1	The second correction for the Moon.....	432
8.2	The exact angular separation between the Sun and the Moon when their difference in longitude $\theta < 90^\circ$	438
8.3	The exact angular separation between the Sun and the Moon when their difference in longitude $\theta > 90^\circ$	441
8.4 <i>a</i>	Converting the separation between the discs into angular measure.	445
8.4 <i>b</i>	The exact angular separation between the Sun and the Moon using coordinate geometry.	446
8.5	The illuminated portion of the Moon as seen by the observer.	450
8.6	The modern definition of the phase (illuminated portion) of the Moon.	451
8.7	Relation between the <i>arkāgrā</i> , <i>āśāgrā</i> and <i>śaṅkuvagrā</i> when planet has northern declination.....	453
8.8	Calculation of <i>drkkarṇa</i> of the Sun.	455
8.9	The sum of or difference between the azimuths of the Sun and the Moon.....	456
8.10	Calculation of the observer's zenith distance (a) of the Sun, (b) of the Moon.	457
8.11	(a) Schematic sketch of the Sun and the Moon with respect to the observer's horizon. (b) The phase of the Moon as seen by the observer for the situation depicted in (a).	459
8.12	(a) Schematic sketch for finding the expression of the <i>śṛṅgonnati</i> using modern spherical trigonometric formulae. (b) The inclination of the line of cusps of the Moon with respect to the plane of the horizon.	460
8.13	Graphical representation of the Moon's disc (a) during the first quarter of the bright fortnight (b) during the last quarter of the bright fortnight.	463
8.14	Graphical representation of the Moon's disc (a) during the first quarter of the dark fortnight, (b) during the last quarter of the dark fortnight.	463

8.15	Ratio of the Sun–planet distance to the Earth–planet distance of an inner planet (a) in <i>yojanas</i> , (b) in terms of the epicycle radius.	466
8.16	Ratio of the Earth–Sun distance to the planet–Sun distance of an outer planet (a) in <i>yojanas</i> , (b) in terms of the epicycle radius.	467
B.1	Spherical triangles formed by the intersection of three great circles on the surface of a sphere.	480
B.2	Spherical triangle <i>ABC</i> with tangents AD and AE.	483
B.3	A spherical triangle with markings on two consecutive sides and consecutive angles.	484
C.1	The horizon and the north celestial pole as seen by the observer on the surface of the Earth.	488
C.2	The celestial sphere for an observer in the northern hemisphere with latitude ϕ	489
C.3	Altitude, azimuth and zenith distance in the horizontal system. ..	491
C.4	Declination, hour angle and right ascension in the equatorial system.	492
C.5	Celestial latitude and longitude in the ecliptic system.	494
C.6	The locus of points traced by the equatorial axis due to precession.	495
C.7	(a) Different orientations of the celestial equator with respect to the ecliptic due to precession; (b) and (c) orientation of the equator and its axis at different epochs about 13000 years apart. .	496
C.8	<i>Nirayana</i> and <i>sāyana</i> longitudes. Γ is the vernal equinox and M is the <i>Meṣādi</i>	498
C.9	Positions of the ‘true’ Sun (S), the ‘mean’ Sun (M) and the ‘dynamical mean’ Sun (D).	499
C.10	Variation in the equation of time over a year.	500
D.1	Measure of the arc connecting two intersecting circles.	501
D.2	The important circles and their secondaries considered in the ‘ten problems’.	503
D.3	The <i>iṣṭa-digvṛtta</i> passing through a planet.	506
D.4	Some important great circles and their secondaries.	507
E.1	Moon’s orbit when the node <i>Rāhu</i> coincides with the vernal equinox Γ	514
E.2	Moon’s orbit when the node <i>Rāhu</i> coincides with the winter solstice.	515
E.3	Moon’s orbit when the node <i>Rāhu</i> coincides with the autumnal equinox.	516
E.4	Moon’s orbit when the node <i>Rāhu</i> coincides with the summer solstice.	516
E.5	The distance between the <i>vikṣepa-pārśva</i> and the north celestial pole.	517
