# Acknowledgments

This book is based on a series of meetings and report developed by the US Environmental Protection Agency (EPA) Science Advisory Board's (SAB's) Hypoxia Advisory Panel. The book presents the view of the authors and does not represent SAB or EPA policy.

The efforts of many people who contributed to the meetings and reviewed earlier drafts of the manuscript are appreciated. We gratefully acknowledge the many individuals who provided their scientific perspectives for the Panel's consideration in the development of this book.

Invited Speakers:

- Rich Alexander, U.S. Geological Survey, *SPARROW Model*
- Jim Ammerman, Rutgers State University, *Effects of nutrients*
- Jeff Arnold, U.S. Department of Agriculture, *SWAT Model*
- James Baker and Dean Lemke, UMRSHNC, *Upper Mississippi Symposia Summary*
- Robert Dean, University of Florida, *Drawing Louisiana's New Map*
- Steven DiMarco, Texas A&M University, *Physical Oceanography in the Gulf*
- Katie Flahive, U.S. Environmental Protection Agency, *Status of the Management Actions Reassessment Team (MART) Report*
- Rick Greene (EPA) and Alan Lewitus (National Oceanic and Atmospheric Administration), *Gulf Science Symposia Summary*
- Dan Jaynes, U.S. Department of Agriculture, *Agricultural N & P Management Approaches*
- Bob Kellogg, U.S. Department of Agriculture, *Status of the Conservation Effectiveness Assessment Program (CEAP)*
- Tim Miller, U.S. Geological Survey, *Monitoring Activities in the Mississippi River basin*
- Marc Ribaud, U.S. Department of Agriculture, *Costs and Benefits of Methods to Reduce Nutrient Loads*
- Don Scavia, University of Michigan, (1) *Science and Policy Context* and (2) *Hypoxia Forecast Models*
- Janice Ward, U.S. Geological Survey, *Fate and Transport Symposia Summary*

## Invited Technical Reviewers:

- Mark Alley, Virginia Tech
- Walter Dodds, Kansas State University
- Madhu Khanna, University of Illinois
- William Wiseman, Jr., National Science Foundation

## Public Commenters:

- James Baker, Iowa Department of Agriculture and Land Stewardship
- Victor Bierman, Donald Boesch, John Day, Robert Diaz, Dubravko Justic, Dennis Keeney, William Mitsch, Nancy Rabalais, Gyles Randall, Donald Scavia, and Eugene Turner, Contributors to the *Integrated Assessment*
- Donald Boesch, University of Maryland Center for Environmental Science
- Darrell Brown, EPA Office of Water
- Daniel Coleman, O'Brien & Gere
- Richard Cruse, Iowa State University
- Doug Daigle, Lower Mississippi River Sub-basin Committee on Hypoxia
- Bob Diaz, Virginia Institute of Marine Sciences
- Michael Duffy, Iowa State University
- Nancy Erickson, Illinois Farm Bureau
- Jason Flickner, Kentucky Waterways Alliance
- Norman Fousey, U.S. Department of Agriculture
- James Fous, U.S. Department of Agriculture
- Doug Gronau, Iowa Farm Bureau Federation
- Ben Grumbles, Assistant Administrator for EPA's Office of Water
- Stephen Harper, O'Brien & Gere
- Chuck Hartke, Illinois Department of Agriculture
- Susan Heathcote, Iowa Environmental Council
- Matthew Helmers, Iowa State University
- Ed Hopkins, Sierra Club
- Chris Hornback, National Association of Clean Water Agencies
- Illinois Department of Agriculture
- Thomas Isenhardt, Iowa State University
- Dan Jaynes, U.S. Department of Agriculture
- Doug Karlen, U.S. Department of Agriculture
- Dennis Keeney, Institute for Agriculture and Trade Policy
- Louis Kollias, Metropolitan Water Reclamation District of Greater Chicago
- Dean Lemke, Iowa Department of Agriculture and Land Stewardship
- Alan Lewitus and David Kidwell, National Oceanic and Atmospheric Administration
- Antonio Mallarino, Iowa State University
- Mark Maslyn, American Farm Bureau Federation
- Dennis McKenna, Illinois Department of Agriculture
- Mississippi River Water Quality Cooperative (MSWQC)

- Bill Northey, Iowa Secretary of Agriculture
- Don Parrish, American Farm Bureau
- Paul Patterson, City of Memphis
- Jean Payne, Illinois Fertilizer and Chemical Association
- Michelle Perez, Environmental Working Group
- Bob and Kristen Perry, Missouri Clean Water Commission
- Nancy Rabalais, Louisiana Universities Marine Consortium
- Russell Rasmussen, Wisconsin Department of Natural Resources
- Jack Riessen, Iowa Department of Natural Resources
- Rick Robinson, Iowa Farm Bureau
- Matt Rota, Gulf Restoration Network
- John Sawyer, Iowa State University
- Al Schafbuch, Affiliation not identified
- Tim Strickland, U.S. Department of Agriculture
- Richard Swenson, U.S. Department of Agriculture
- Michael Tate, Kansas Department of Health and Environment
- Steve Taylor, Environmental Resource Coalition
- Mark Tomer, U.S. Department of Agriculture
- Eugene Turner, Louisiana State University
- Ford B. West, The Fertilizer Institute
- Wendy Wintersteen, Iowa State University

The book never could have come to fruition without the efforts of Frederick O'Hara in editing the book. His careful attention to the details and to effective communication is appreciated.

I appreciate the support of the Environmental Sciences Division at Oak Ridge National Laboratory and, especially, of my children.

Oak Ridge, Tennessee  
December 2007

Virginia H. Dale

# Contents

<b>1</b>	<b>Introduction</b>	1
1.1	Hypoxia and the Northern Gulf of Mexico – A Brief Overview	1
1.2	Science and Management Goals for Reducing Hypoxia	3
1.3	Hypoxia Study Group	4
1.4	The Study Group’s Approach	7
<b>2</b>	<b>Characterization of Hypoxia</b>	9
2.1	Historical Patterns and Evidence for Hypoxia on the Shelf	9
2.2	The Physical Context	12
2.2.1	Oxygen Budget: General Considerations	12
2.2.2	Vertical Mixing as a Function of Stratification and Vertical Shear	13
2.2.3	Changes in Mississippi River Hydrology and Their Effects on Vertical Mixing	15
2.2.4	Zones of Hypoxia Controls	18
2.2.5	Shelf Circulation: Local Versus Regional	20
2.3	Role of N and P in Controlling Primary Production	23
2.3.1	Nitrogen and Phosphorus Fluxes to the NGOM Background	23
2.3.2	N and P Limitation in Different Shelf Zones and Linkages Between High Primary Production Inshore and the Hypoxic Regions Farther Offshore	24
2.4	Other Limiting Factors and the Role of Si	29
2.5	Sources of Organic Matter to the Hypoxic Zone	31
2.5.1	Sources of Organic Matter to NGOM: Post 2000 Integrated Assessment	33
2.5.2	Advances in Organic Matter Understanding: Characterization and Processes	34
2.5.3	Synthesis Efforts Regarding Organic Matter Sources	37
2.6	Denitrification, P Burial, and Nutrient Recycling	38
2.7	Possible Regime Shift in the Gulf of Mexico	41
2.8	Single Versus Dual Nutrient Removal Strategies	44
2.9	Current State of Forecasting	46

- 3 Nutrient Fate, Transport, and Sources . . . . . 51**
  - 3.1 Temporal Characteristics of Streamflow and Nutrient Flux . . . . . 51
    - 3.1.1 MARB Annual and Seasonal Fluxes . . . . . 56
    - 3.1.2 Subbasin Annual and Seasonal Flux . . . . . 65
  - 3.2 Mass Balance of Nutrients . . . . . 76
    - 3.2.1 Cropping Patterns . . . . . 76
    - 3.2.2 Nonpoint Sources . . . . . 77
    - 3.2.3 Point Sources . . . . . 84
  - 3.3 Nutrient Transport Processes . . . . . 87
    - 3.3.1 Aquatic Processes . . . . . 87
    - 3.3.2 Freshwater Wetlands . . . . . 93
    - 3.3.3 Nutrient Sources and Sinks in Coastal Wetlands . . . . . 94
  - 3.4 Ability to Route and Predict Nutrient Delivery to the Gulf . . . . . 96
    - 3.4.1 SPARROW Model . . . . . 97
    - 3.4.2 SWAT Model . . . . . 103
    - 3.4.3 IBIS/THMB Model . . . . . 104
    - 3.4.4 Discussion and Comparison of Models . . . . . 106
    - 3.4.5 Targeting . . . . . 106
    - 3.4.6 Model Uncertainty . . . . . 107
  
- 4 Scientific Basis for Goals and Management Options . . . . . 111**
  - 4.1 Adaptive Management . . . . . 111
  - 4.2 Setting Targets for Nitrogen and Phosphorus Reduction . . . . . 115
  - 4.3 Protecting Water Quality and Social Welfare in the Basin . . . . . 120
    - 4.3.1 Assessment and Review of the Cost Estimates from the CENR Integrated Assessment . . . . . 121
    - 4.3.2 Other Large-Scale Integrated Economic and Biophysical Models for Agricultural Nonpoint Sources . . . . . 125
    - 4.3.3 Research Assessing the Basin-Wide Co-benefits . . . . . 128
    - 4.3.4 Principles of Landscape Design . . . . . 129
  - 4.4 Cost-Effective Approaches for Nonpoint Source Control . . . . . 133
    - 4.4.1 Voluntary Programs – Without Economic Incentives . . . . . 134
    - 4.4.2 Existing Agricultural Conservation Programs . . . . . 135

# List of Figures

1.1	Map of the frequency of hypoxia in the northern Gulf of Mexico, 1985–2005. Taken from N.N. Rabalais, LUMCON, 2006 . . . . .	2
1.2	Map showing the extent of the Mississippi–Atchafalaya River basin . . . . .	2
2.1	Plots of the PEB index (%PEB) in sediment cores from the Louisiana shelf. Higher values of the PEB index indicate lower dissolved oxygen contents in bottom waters. Taken from Osterman et al. (2005) . . . . .	11
2.2	Change in the relative importance of the Atchafalaya flow to the combined flows from the Mississippi and Atchafalaya Rivers over the 20th century. Reprinted from Bratkovich et al. (1994) . . . . .	15
2.3	Modeled surface salinity showing the freshwater plumes from the Atchafalaya and Mississippi Rivers during upwelling-favorable winds (top panel) and during downwelling favorable winds 8 days later (bottom panel). Adapted from Hetland and DiMarco (2007) . . . . .	17
2.4	Proposed diversions of Mississippi effluents for coastal protection. From Coastal Protection and Restoration Authority (CPRA) of Louisiana, 2007 Integrated Ecosystem Restoration and Hurricane Protection: Louisiana’s Comprehensive Master Plan for a Sustainable Coast. CPRA, Office of the Governor (LA) 117 pp . . . . .	18
2.5	An illustration depicting different zones (Zones 1–4, numbered above) in the NGOM during the period when hypoxia can occur. These zones are controlled by differing physical, chemical, and biological processes, are variable in size, and move temporally and spatially. Diagram created by D. Gilbert . . . . .	19
2.6	Response of natural phytoplankton assemblages from coastal NGOM stations to nutrient additions, March through September. All experiments, except those done in September,	

indicate a strong response to P additions. Taken from Sylvan et al., 2006 . . . . . 25

2.7 NASA-SeaWiFS image of the Northern Gulf of Mexico recorded in April, 2000. This image shows the distributions and relative concentrations of chlorophyll *a*, an indicator of phytoplankton biomass in this region. Note the very high concentrations (orange to red) present in the inshore regions of the mouths of the Mississippi and Atchafalaya Rivers . . . . . 26

3.1 Estimated extent of agricultural drainage based on the distribution of row crops, largely corn and soybean, and poorly drained soils (per D. Jaynes, National Soil Tilth Lab, Ames, IA) . . . . . 52

3.2 Land cover based on Landsat data (adapted from Crumpton et al., 2006) . . . . . 53

3.3 Flow-weighted average nitrate concentrations estimated from STORET data selected to exclude point source influences (adapted from Crumpton et al., 2006) . . . . . 54

3.4 Flow-weighted average nitrate and reduced N versus percent cropland (adapted from Crumpton et al., 2006) . . . . . 54

3.5 MARB nitrate-N fluxes for 1955 through 2005 water years comparing estimates from various methods for 1979–2005. Based on USGS data from Battaglin (2006) and Aulenbach et al. (2007) . . . . . 55

3.6 Comparison (percent and absolute basis) of MARB nitrate-N fluxes to LOADEST 5-year method for 1979 through 2005 water years. Based on USGS data from Battaglin (2006) and Aulenbach et al. (2007) . . . . . 57

3.7 Schematic showing locations of MARB monitoring sites (Aulenbach et al., 2007) . . . . . 58

3.8 Flow and available nitrogen monitoring data for the MARB for 1955 through 2005 water years (LOWESS, locally weighted scatterplot smooth, curves shown as a *solid line*). LOWESS describes the relationship between Y and X without assuming linearity or normality of residuals and is a robust description of the data pattern (Helsel and Hirsch, 2002) . . . . . 59

3.9 Flow, available phosphorus, and available silicate monitoring data for the MARB for 1955 through 2005 water years (LOWESS curves shown as a *solid line*). Based on USGS data from Battaglin (2006) and Aulenbach et al. (2007) . . . . . 60

3.10 Ratio of total N to total P and dissolved silicate to dissolved inorganic N for MARB for the 1980 through 2005 water years. Based on USGS data from Battaglin (2006) and Aulenbach et al. (2007) . . . . . 61

3.11 Flow and nitrogen flux for the MARB during spring (April, May, and June) for the period 1979–2005 (LOWESS curve shown as a *solid line*). Based on USGS data from Battaglin (2006) and Aulenbach et al. (2007) . . . . . 62

3.12 Flow, phosphorus, and silicate flux for the MARB during spring (April, May, and June) for the period 1979–2006 (LOWESS curve shown as a *solid line*). Based on USGS data from Battaglin (2006) and Aulenbach et al. (2007) . . . . . 63

3.13 Sum of April, May and June fluxes as a percent of annual (water year basis) for combined Mississippi mainstem and Atchafalaya River. *Box* plots show median (*line in center of box*), 25th and 75th percentiles (*bottom and top of box*, respectively), 10th and 90th percentiles (*bottom and top error bars*, respectively), and values <10th percentile and >90th percentile (*solid circles* below and above *error bars*, respectively). Based on USGS data from Battaglin (2006) and Aulenbach et al. (2007) . . . . . 64

3.14 Ratio of total N to total P and silicate to dissolved inorganic N for the MARB during spring (April, May, and June) for the period 1980–2006. Based on USGS data from Battaglin (2006) and Aulenbach et al. (2007) . . . . . 65

3.15 Location of nine large subbasins comprising the MARB that are used for estimating nutrient fluxes (from Aulenbach et al., 2007) . . . . . 66

3.16 Net N inputs and annual nitrate-N fluxes and yields for the Ohio River subbasin. (LOWESS curves for riverine nitrate-N shown with *solid lines*.) Based on USGS data from Battaglin (2006) and Aulenbach et al. (2007) . . . . . 70

3.17 Net N inputs and annual nitrate-N fluxes and yields for the upper Mississippi River subbasin. (LOWESS curves for riverine nitrate-N shown with *solid lines*.) Shown in triangles is a recalculated net N input for the upper Mississippi River basin, increasing soybean N<sub>2</sub> fixation from 50 to 70% of above ground N, and a soil net N mineralization rate from 0 to 10 kg N/ha-year. Based on USGS data from Battaglin (2006) and Aulenbach et al. (2007) . . . . . 71

3.18 Total P and particulate/organic P fluxes for the Ohio River near Grand Chain, Illinois (LOWESS curves shown in *solid and dashed lines*). Based on USGS data from Battaglin (2006) and Aulenbach et al. (2007) . . . . . 72

3.19 Spring water flux and nitrate-N flux for the Mississippi River at Grafton and the Ohio River at Grand Chain, IL, for water years 1975–2005 (LOWESS curves shown with *solid lines*.) Based on USGS data from Battaglin (2006) and Aulenbach et al. (2007) . . . . . 73

3.20 Spring nitrate-N flux (sum of April, May, and June) for the Mississippi River at Grafton plus Ohio River at Grand Chain subbasins compared to the combined Mississippi and Atchafalaya River for 1979 through 2005. Based on USGS data from Battaglin (2006) and Aulenbach et al. (2007) . . . . . 74

3.21 Area of major crops planted in the MARB from 1941 through 2007. Adapted from McIsaac (2006) . . . . . 76

3.22 Nitrogen mass balance components and net N inputs for the MARB, as calculated by McIsaac et al. (2002) and updated through 2005 by McIsaac (2006) . . . . . 78

3.23 Net N inputs for the four major regions of the MARB through 2005. Adapted from McIsaac (2006) . . . . . 79

3.24 Nitrogen mass balance components and net N inputs for the upper Mississippi River basin, as calculated by McIsaac et al. (2002) and updated through 2005 by McIsaac (2006) . . . . . 81

3.25 Phosphorus mass balance components and net P inputs for the MARB. Adapted from McIsaac (2006) . . . . . 82

3.26 Net P inputs for the four major subbasins of the MARB through 2005. Adaptive from McIsaac (2006) . . . . . 83

3.27 Phosphorus mass balance components and net N inputs for the upper Mississippi River basin. Adapted from McIsaac (2006) . . . . . 85

3.28 Total phosphorus point source fluxes as a percent of total flux for the MARB for 2004 by hydrologic region . . . . . 86

3.29 Percentage of nutrient inputs to streams that are removed by in-stream and reservoir processes as predicted by the SPARROW model (Alexander et al., 2008) . . . . . 88

3.30 N removed in aquatic ecosystems (as a % of inputs) as a function of ecosystem depth/water travel time (modified from David et al., 2006). Values shown are for 23 years in an Illinois reservoir (David et al., 2006), French reservoirs (Garnier et al., 1999), Illinois streams (an average from Royer et al., 2004), agricultural streams (Opdyke et al., 2006), and rivers (Seitzinger et al., 2002). The curve from Seitzinger et al. (2002) is not as steep as the curve that includes information from reservoirs in an agricultural region . . . . . 90

4.1 A conceptual framework for hypoxia in the northern Gulf of Mexico . . . . . 112

4.2 Percent mass nitrate removal in wetlands as a function of hydraulic loading rate. Best fit for percent mass loss =  $103 * (\text{hydraulic loading rate})^{-0.33}$  ( $R^2 = 0.69$ ). Adapted from Crumpton et al. (2006, 2008) . . . . . 147

4.3 Observed NO<sub>3</sub> mass removal (*blue points*) versus predicted NO<sub>3</sub> mass removal (*blue surface*) based on the function [mass NO<sub>3</sub> removed = 10.3\*(HLR)<sup>0.67</sup> \* FWA] for

which  $R^2 = 0.94$ . *Blue lines* are isopleths of predicted mass removal at intervals of 250 kg/ha-year. The *dashed, red line* represents the isopleth for mass removal rate of 290 kg/ha-year suggested by Mitsch et al. (2005a). The *green plane* intersecting function surface represents organic N export. Adapted from Crumpton et al. (2006, 2008) . . . . . 148

4.4 Recoverable manure N, assuming no export of manure from the farm, using 1997 census data. Adapted from USDA (2003) with the author’s permission . . . . . 158

4.5 Recoverable manure P, assuming no export of manure from the farm, using 1997 census data. Adapted from USDA (2003) with the author’s permission . . . . . 159

4.6 Fertilizer N consumption as anhydrous ammonia in leading corn-producing states for years ending June 30 . . . . . 165

4.7 Changes in the consumption of principal fertilizer N sources used in the six leading corn-producing states (IA, IL, IN, MN, NE, and OH) for years ending June 30 . . . . . 165

4.8 Percentage of N-fertilized corn acreage that received some amount of N in the fall . . . . . 166

4.9 USDA ARMS data for the three states with highest fall N application, showing total amount of fall-applied N for that crop. Also shown are Illinois sales data for the same period . . . . . 167

4.10 Fraction of annual fertilizer N tonnage in Illinois sold in the fall . . . . . 168

4.11 Average corn yields in six leading corn-producing states (IA, IL, IN, MN, NE, and OH), 1990–2006 (Source: USDA National Agricultural Statistics Service) . . . . . 171

4.12 Variability in soil test P levels in typical farmer fields in Minnesota (2007 personal communication with Dr. Gary Malzer, University of Minnesota) . . . . . 178

4.13 Effect of variable-rate versus uniform-rate application of liquid swine manure on changes in soil test phosphorus in Iowa fields [2007 personal communication with Dr. Antonio Mallarino, Iowa State University and Wittry and Mallarino (2002)] . . . . . 179

4.14 Effect of variable-rate versus uniform-rate application of fertilizer P on soil test P in multiple Iowa fields across multiple years . . . . . 180

B.1 Nitrogen cycle flow diagram. Taken from Encyclopedia of Earth (2007) at [http://www.eoearth.org/global\\_material\\_cycles](http://www.eoearth.org/global_material_cycles) . . . . . 223

B.2 Phosphorus cycle flow diagram. Taken from Encyclopedia of Earth (2007) at [http://www.eoearth.org/global\\_material\\_cycles](http://www.eoearth.org/global_material_cycles) . . . . . 224

B.3 Silicon cycle flow diagram. Taken from Encyclopedia of Earth (2007) at [http://www.eoearth.org/global\\_material\\_cycles](http://www.eoearth.org/global_material_cycles) . . . . . 225

# List of Tables

2.1	A partial summary of papers published following the <i>Integrated Assessment</i> related to sources of organic matter to the Gulf of Mexico . . . . .	34
3.1	Average annual nutrient fluxes in 1000 metric tons for the five large subbasins in the MARB for the 2001–2005 water years. (Percent of total basin flux shown in parentheses) . . . . .	67
3.2	Average annual nutrient fluxes for 10 subbasins in the MARB for the 2001–2005 water years. Some subbasin fluxes are calculated as the difference between the upstream and the downstream monitoring station. (Percent of total basin flux shown in parentheses) . . . . .	68
3.3	Average annual nutrient yields in kg/ha-year for the five large subbasins in the MARB for water years 2001–2005 . . . . .	68
3.4	Average annual nutrient yields for nine subbasins in the MARB for the 2001–2005 water years. Some subbasin yields are calculated as the difference between the upstream and the downstream monitoring stations . . . . .	69
3.5	Acres of wetlands created, restored, or enhanced in major subbasins of the Mississippi River from 2000 to 2006 under the Wetland Reserve Program (WRP), Conservation Reserve Program (CRP), Conservation Reserve Enhancement Program (CREP), Environmental Quality Incentive Program (EQIP), and Conservation Technical Assistance (CTA). (Personal communication, Mike Sullivan, USDA) . . . . .	93
3.6	Attributes of models used to estimate sources, transport, and/or delivery of nutrients to the Gulf of Mexico . . . . .	98
4.1	Annual and spring (sum of April, May, June) average flow and N and P fluxes for the MARB for the 1980–1996 reference period compared to the most recent 5-year period (2001–2005). Load reductions in mass of N or P also shown . . . . .	116
4.2	Summary of study features of basin-wide integrated economic-biophysical models . . . . .	123

4.3 Summary of policies and findings from integrated economic-biophysical models . . . . . 124

4.4 Areas (ha) of conservation buffers installed in the six subbasins of the MARB for FY 2000–FY2006 . . . . . 154

4.5 Status of implementation of permits under the 2003 CAFO rule for states within the MARB. Data provided by USEPA Office of Wastewater Management, 2007 . . . . . 160

4.6 Estimates of manure production and N and P loss to water and air from Animal feeding operations within the Mississippi River basin. Total manure in millions of milligrams; other materials in millions of kilograms. Based on information from the 2002 US Census of Agriculture (adapted from Aillery et al., 2005) . . . . . 162

4.7 Partial N balance for 4-year rate study by Jaynes et al. (2001). The last two columns were added here and were not part of original table . . . . . 174

4.8 Estimated changes in N losses from cropping changes predicted by FAPRI from 2007 to 2013 . . . . . 192

4.9 Potential total nitrogen (TN) and phosphorus (TP) efficiencies (percent change) produced by *nutrient-use* conservation practices on surface runoff, subsurface flow, and tile drainage. Estimates are average values for a multiple-year basis, and some of the numbers in this table are based on a very small amount of field information. Shading highlights the methods producing the greatest reduction efficiencies within the three types of N and P loss (surface runoff, subsurface, and tile drainage) . . . . . 197

4.10 Potential total nitrogen (TN) and phosphorus (TP) efficiencies (percent change) produced by *in-field* conservation practices on surface runoff, subsurface flow, and tile drainage. Estimates are average values for a multiple-year basis, and some of the numbers in this table are based on a very small amount of field information. Shading highlights the methods producing the greatest reduction efficiencies within the three types of N and P loss (surface runoff, subsurface, and tile drainage) . . . . . 198

4.11 Potential total nitrogen (TN) and phosphorus (TP) efficiencies (percent change) produced by *off-site* conservation practices on surface runoff, subsurface flow, and tile drainage. Estimates are average values for a multiple-year basis, and some of the numbers in this table are based on a very small amount of field information. Shading highlights the methods producing the greatest reduction efficiencies within the three types of N and P loss (surface runoff, subsurface, and tile drainage) . . . . . 199

4.12 Anticipated benefits associated with different agricultural management options . . . . . 200

4.13	Anticipated benefits associated with other management options . . . . .	201
C.1	Farming system and nutrient budget; amounts given in kg ha <sup>-1</sup> year <sup>-1</sup> . . . . .	228
C.2	Number of animals and amount of manure produced and N and P excreted within the MARB states based on information from the 1997 US Census of Agriculture (data obtained from USDA-ERS, <a href="http://ers.usda.gov/data/MANURE/">http://ers.usda.gov/data/MANURE/</a> ) . . . . .	228
D.1	Comparison of MART estimated sewage treatment plant annual effluent loads of total N and P and values from measurements at each plant for 2004 . . . . .	232

Authors of *Hypoxia in the Northern Gulf of Mexico*

**To the HAP Panelists**

Serving on the Hypoxia Advisory Panel gave you each the unique opportunity to channel your experience, knowledge, perspective, wisdom, and thought into a set of key recommendations of what ought to be done to sample, learn about, manage, and protect resource use in the Mississippi Basin that affects low-oxygen conditions in the Gulf of Mexico and other co-benefits, such as clean air, the flow of water, recreation, and rural amenities.

The natural system will benefit from your expertise if the many suggestions and key recommendations (for which are provided lengthy, detailed explanations) will be used to improve those river and Gulf conditions that allow the Mississippi Basin to transition to a healthy and sustainable ecosystem that supports life and our economy with vigor and vim.

Virginia H. Dale, June 2007

# Glossary

**Algae** A group of chiefly aquatic plants (e.g., seaweed, pond scum, stonewort, phytoplankton) that contain chlorophyll and may passively drift, weakly swim, grow on a substrate, or establish root-like anchors (steadfasts) in a water body.

**Anaerobic digestion** Decomposition of biological wastes by micro-organisms, usually under wet conditions, in the absence of air (oxygen), to produce a gas comprising mostly methane and carbon dioxide.

**Animal feeding operation (AFO)** An agricultural enterprises where animals are kept and raised in confined situations. AFOs congregate animals, feed, manure, urine, dead animals, and production operations on a small land area. Feed is brought to the animals rather than the animals grazing or otherwise seeking feed in pastures, in fields, or on rangeland. Winter feeding of animals on pasture or rangeland is not normally considered an AFO.

**Anoxia** The absence of dissolved oxygen.

**Bacterioplankton** The bacterial component of the plankton that drifts in the water column.

**Benthic organisms** Organisms living in association with the bottom of aquatic environments (e.g., polychaetes, clams, snails).

**Best Management Practices (BMPs)** Effective, practical, structural, or nonstructural methods that are designed to prevent or reduce the movement of sediment, nutrients, pesticides, and other chemical contaminants from the land to surface or ground water, or which otherwise protect water quality from potential adverse effects of agricultural activities. These practices are developed to achieve a cost-effective balance between the water quality protection and the agricultural production (e.g., crop, forage, animal, forest).

**Bioenergy** Useful, renewable energy produced from organic matter – the conversion of the complex carbohydrates in organic matter to energy. Organic matter may either be used directly as a fuel, processed into liquids and gasses, or be a residual of processing and conversion.

**Biogas** A combustible gas derived from decomposing biological waste under anaerobic conditions. Biogas normally consists of 50–60% methane. See also landfill gas.

**Biomass** Any organic matter that is available on a renewable or recurring basis, including agricultural crops and trees, wood and wood residues, plants (including aquatic plants), grasses, animal residues, municipal residues, and other residue materials. Biomass is generally produced in a sustainable manner from water and carbon dioxide by photosynthesis. There are three main categories of biomass – primary, secondary, and tertiary.

**Bioreactor** A container in which a biological reaction takes place. As used in this book, a bioreactor is a container or a trench filled with a biodegradable carbon source used to enhance biological denitrification for removal of nitrate from drainage water.

**Biosolids** Nutrient-rich soil-like materials resulting from the treatment of domestic sewage in a treatment facility. During treatment, bacteria and other tiny organisms break sewage down into organic matter, sometimes used as fertilizer.

**Cellulosic ethanol** Ethanol that is produced from cellulose material; a long chain of simple sugar molecules and the principal chemical constituent of cell walls of plants.

**Chlorophyll** Pigment found in plant cells that are active in harnessing energy during photosynthesis.

**Conservation Reserve Program (CRP)** CRP provides farm owners or operators with an annual per-acre rental payment and half the cost of establishing a permanent land cover, in exchange for retiring environmentally sensitive cropland from production for 10–15 years. In 1996, Congress reauthorized CRP for an additional round of contracts, limiting enrollment to 36.4 million acres at any time. The 2002 Farm Act increased the enrollment limit to 39 million acres. Producers can offer land for competitive bidding based on an Environmental Benefits Index (EBI) during periodic signups or can automatically enroll more limited acreages in practices such as riparian buffers, field windbreaks, and grass strips on a continuous basis. CRP is funded through the Commodity Credit Corporation (CCC).

**Conservation practices (CPs)** Any action taken to produce environmental improvements, particularly with respect to agricultural nonpoint source emissions. The term is used broadly to refer to structural practices, such as buffers, as well as nonstructural practices, such as in-field nutrient management planning and application. Conservation practice standards have been developed by NRCS and are available at <http://www.nrcs.usda.gov/Technical/Standards/nhpc.html>

**Corn stover** Corn stocks that remain after the corn is harvested. Such stocks are low in water content and very bulky.
