Preface

Ever since agricultural cultivation came into existence, plant systems and their functions are manipulated rapidly both by humans and nature. Biotic and abiotic stresses adversely affect crop productivity. Plant breeding and genetic engineering have enabled maximizing crop productivity even under minimal stress conditions. However, such tools also have their limitations and so the reverse genetic and functional genomic approaches came into practice. With the availability of genome sequences in several plant species, the major focus has been on identification of the functional role of several signaling networks and components involved in regulating stress tolerance pathways. A signaling cascade begins with sensing the stimulus, and the basic outcome of any signaling machinery is to bring out the final response. But at the start and end of any phenomenon, there are certain characters that play their role to assist the process. There are various molecules inside the cellular machinery, which are involved in transducing the signals.

Calcium plays a pivotal role in regulating the physiological and developmental processes in plants. Till now, several calcium sensors have been discovered, which regulate the diverse signaling pathways involved in plant growth and development. One of the major calcium sensors CBL (calcineurin B-like) is decoding the calcium signal during various environmental stresses in plants. Calcium-mediated signal is transduced downstream by CBL-interacting protein kinases (CIPKs), which generally phosphorylate the target proteins such as transcription factors or transporters/channel leading to a response. Mutant-based approach has provided valuable information in the functional analysis of individual members of *CBL* and *CIPK* gene family in *Arabidopsis*. Both *CBL* and *CIPK* gene families have previously been identified and characterized in *Arabidopsis* and rice. Identification and characterization of *CBLs* and *CIPKs* in other plant species such as *Oryza sativa*, *Pisum sativum*, *Cicer arietinum*, *Zea mays*, *Populus euphratica*, *Vitis vinifera*, *Malus domestica*, *Gossypium hirsutum*, *Sorghum bicolor*, *Brassica napus*, *Vicia faba*, *Phaseolus vulgaris*, *Ammopiptanthus mongolicus* and *Triticum aestivum* are still at a juvenile stage.

An up-to-date research in the field of CBL–CIPK signaling transduction components, basic and advanced, in various genera has been reviewed here. Also,

current understanding and knowledge of genome-wide organization, evolution, structure, sub-cellular localization, and biochemical properties of CBLs and CIPKs in plants is discussed in various sections of this book. In the first few sections, there is a basic overview of the field of CBL–CIPK signaling, which is accompanied by genomic organization of CBL and CIPK component throughout the plant kingdom. CBL and CIPK proteins distributed in the plant cell and also in different tissues and organs might be involved in executing a particular function. The expression analysis of *CBLs* and *CIPKs* during different developmental stages as well as under different physiological conditions also hints toward their functional role during these particular conditions. So, not only the change in mRNA level but protein modification may also be a strategy to provide specificity for CBL–CIPK signaling. In the subsequent sections, phosphorylation, interaction, and biochemical properties of CBLs and CIPKs are discussed. Finally in a few sections, the targets of CBL–CIPKs and the functional role identified for several CBLs and CIPKs during different environmental stresses, nutrient deficiency, and developmental stages is discussed case-by-case in *Arabidopsis* and other higher plant species.

Overall, this comprehensive study is focused on the diverse role of the CBL–CIPK module in different stress signaling and also to identify a newly emerging role of this calcium-signaling module in plant growth and development across different plant species. In addition, besides *Arabidopsis*, it provides a backbone of knowledge to perform detailed molecular investigation in crop plant species and could possibly enable in designing strategies to tame abiotic stress tolerance and development in important agronomical crop plants. This book will act as a handy and informative source in this field for students as well as advanced researchers.

Acknowledgments

We are thankful to the Department of Science and Technology (DST) and the Department of Biotechnology (DBT), India, for supporting the research work in GKP's lab. We also express our thanks to Dr. M. C. Tyagi, Mr. Sibaji Sanyal, and Mr. Shashank Maurya for critical reading of this manuscript.

Contents

1 Basic Terms and Overview of Contents	1
1.1 Introduction	1
1.2 Calcium on the Way of Signaling.	2
1.3 CBLs: The Calcium Sensor	2
1.4 History and Concepts.	4
1.4.1 Discovery	4
1.4.2 New Paradigm	6
References	7
2 Genomic Organization	13
2.1 Introduction	13
2.2 CBL and CIPK Complements	15
2.2.1 CBL- and CIPK-Type Proteins in Protozoan	15
2.2.2 CBL and CIPK in Algae.	15
2.2.3 CBL and CIPK in Higher Plants	15
2.3 Genomic Architecture	16
2.4 Gene Structure	16
2.5 Phylogenetic Relatedness and Evolution	17
References	17
3 Distribution and Expression in Plants.	19
3.1 Introduction	19
3.2 Distribution of CBLs and CIPKs in Plants	20
3.3 Expressions under Various Environmental and Developmental Conditions	21
3.4 Expression of Stress Markers Genes in Mutant and Overexpressor of CBL and CIPKs	23
References	25

4 Protein Structure and Localization	29
4.1 Introduction	29
4.2 Motifs and Domains	30
4.2.1 Motifs in the CBLs	30
4.2.2 Motifs in the CIPKs	31
4.3 Protein Structure	31
4.3.1 Three-Dimensional Structure of CBLs	31
4.3.2 CBL–CIPK Complexes	32
4.4 Subcellular Localization	32
4.4.1 Subcellular Localization of CBL Gene Family	32
4.4.2 Subcellular Localization of CIPK Gene Family	33
4.4.3 Subcellular Targeting of CBL–CIPK Complexes	33
References	35
5 Biochemical Properties of CBLs and CIPKs	39
5.1 Introduction	39
5.2 Mutagenesis of CIPKs to Generate Hyperactive Kinase or Dead Kinase	40
5.3 Function of Auto-phosphorylation in CIPKs	41
5.4 Physiological Target/Substrate of CIPKs	41
5.5 Phosphorylation of CBL by Their Interacting CIPK	42
References	43
6 Protein Interactions	45
6.1 Introduction	45
6.2 Various Interactors of CBLs	46
6.2.1 CIPKs	46
6.2.2 Others	46
6.3 Various Targets of CIPKs	46
6.3.1 Phosphatases	47
6.3.2 Transporters/Channels	47
6.3.3 Transcription Factors	48
6.3.4 Enzymes	48
6.4 CBL–CIPK Complexes Regulate a Broad Range of Functions	49
References	49
7 Functional Role of CBL–CIPK in Nutrient Deficiency	51
7.1 Introduction	51
7.2 Nitrate Deficiency	51
7.3 Potassium Deficiency	53
7.3.1 CBL–CIPK23–AKT1	53
7.3.2 CBL2/3–CIPK9–Unknown Target	55
7.3.3 Other CBL–CIPKs Regulating AKT1	56

Contents	ix
7.3.4 CBL4–CIPK6–AKT2.....	58
7.3.5 CBL–CIPK Regulating K ⁺ Nutrition in Other Plants Species.....	59
