1 What is a star map?	1
1.1 Constellation maps	1
1.2 Cosmological maps	3
1.3 What makes these images maps?	5
1.4 Circles in the sky	6
1.4.1 The Sun–Earth orientation	6
1.4.2 The armillary sphere	7
1.5 Directions in the sky	10
1.6 Projections of star maps	12
1.7 Manuscripts and prints	13
1.8 Bibliography	15
2 Non-European cosmology and constellation development	17
2.1 China	18
2.1.1 Cosmology	18
2.1.2 Time and the calendar	19
2.1.3 Chinese constellations	20

2.1.4	Chinese influences in Korea and Japan	23
2.1.5	Outside influences on China	24
2.2	Mesopotamia	25
2.2.1	Historical interlude	25
2.2.2	Cosmology	26
2.2.3	Time and the calendar	28
2.2.4	Mesopotamian constellations and the zodiac	28
2.3	Egypt	29
2.3.1	Cosmology	29
2.3.2	Time and the calendar	30
2.3.3	Orientation of temples	32
2.3.4	Egyptian constellations	32
2.3.5	Differences from China and Mesopotamia	34
2.4	India	35
2.4.1	Cosmology	35
2.4.2	Time and the calendar	38
2.4.3	Indian constellations	38
2.4.4	Outside influences	39
2.5	Astrology in ancient times	40
2.6	Bibliography	45
3	European cosmology	49
3.1	Classical Greek astronomy	49
3.1.1	Precursors	49
3.1.2	The cosmologies of early Greek philosophers	50
3.1.3	Pythagoras and his followers	52
3.1.4	Plato	53
3.1.5	Eudoxus	54
3.1.6	Aristotle	55
3.1.7	The “Pre-Copernicans”	56
3.1.8	Eratosthenes and the Alexandria Library	57
3.1.9	The eccentric model	57
3.1.10	Apollonius and the epicycle model	58
3.1.11	Hipparchus	61
3.1.12	Claudius Ptolemy	62
3.2	European astronomy during the early Middle Ages	65
3.2.1	Impact of the fall of Rome	65

Preface to Second Edition

Star Maps: History, Artistry, and Cartography was first published in 2007. A second printing, which was similar to the first except for a few minor editorial changes, came out in 2009. When faced with the need to print more books in 2011, the question was whether or not to publish a third printing or issue a brand new edition. After all, how much new material could there be in a book that was mainly historical and focused on a fairly discrete and specialized topic?

As it turned out, plenty! This second edition, published in 2012, contains over 50 new pages, has 44 new images (16 in color), and lists over 60 additional references, most of which come from primary sources. These changes are in part due to new material that has appeared in scholarly map and astronomy journals and specialty magazines. But in addition, I have responded to helpful recommendations from the reviewers of the first edition, not to mention comments made by people attending my lectures on the history of celestial cartography. And to be honest, I have purchased new prints for my collection and developed new sub-interests in the past few years that I wanted to include.

As a result, I have reread the entire first edition and made a number of editorial changes and updates. In Chapter 3, mention is made of the Neoplatonist Hypatia. In Chapter 4, Caspar Vopel rather than Gerard Mercator is credited with introducing the constellations Antinous and Coma Berenices on his celestial globe, and a figure showing Antinous has been added. In Chapter 6, a new Hevelius map replaces the former Figure 6.6. Significant additions have been made to Chapter 8, including new figures and text in the celestial globe, volvelle, telescope, planets, and Moon sections; mention of the Nebula sky disk and astronomer Thomas Harriot; and entirely new sections on asteroids, deep sky objects, playing card maps, and frontispieces and title pages. In Chapter 9, there is new material on colonial America and on astronomy writer Hannah Mary Bouvier. In Chapter 10, there are several new figures and new sections on astronomer Johann von Littrow and computerized star maps.

A new Chapter 11 collects all the color figures into a single Color Plate Gallery. Corrections and updates also appear in the appendices.

Although much has been added to this second edition, not every recommended change was made. For example, some reviewers of the first edition suggested that I add material on prehistoric and indigenous sky maps. However, as I stated in the Preface to the first edition, the main focus of this book is the European sky mapping tradition, and to go beyond the cultures mentioned in Chapter 2 would take us too far afield. Similarly, the historical information in Chapters 3 and 4 was selected to be a primer for the reader to better understand the meaning of the sky maps described in subsequent chapters, not to be an exhaustive history of astronomy. For this, the reader is referred to the texts referenced in the chapter bibliographies.

Nick Kanas
January 2012

Foreword to First Edition

The representation of celestial bodies (stars, planets, comets and other extraterrestrial phenomena) has been an important part of cartography for millennia. Star maps of early Chinese, Indian, Mesopotamian, Egyptian and other cultures are significant in their own right but also because of their influence on Greek, Roman, Islamic and, later, European celestial cartography. The history of changing images and practices in this field up to the present is discussed and illustrated in admirable detail in *Star Maps*, by Nick Kanas.

As with a number of others interested in cartography, the author is a medical doctor who has devoted a great deal of time and resources to studying and writing about his long-term avocation. However, most collectors have an interest in a limited time period or geographical area (e.g., the eighteenth century or Jamaica). By contrast, Dr. Kanas has a longer and larger agenda: the representation of the heavens from antiquity to the present, as illustrated by maps and charts.

In order to cover his wide-ranging subject, Nick Kanas' book features over 200 images, 76 in color. Each of these images is discussed in the text in appropriate detail. Most of the illustrations are miniaturized, but they are generally well reproduced and remarkably readable. Similarly, the text is lucid and can be appreciated by specialists, but also by collectors and others. In addition to the maps and their descriptions, the volume contains a glossary and other reading aids.

Undoubtedly, *Star Maps* will become an important reference work in civic, institutional, college and university libraries, but individuals who are interested in the topics it covers will want to have their own copy. The distinguished scientific publishing house of Springer, in association with Praxis of Chichester, U.K., is to be commended for undertaking to make such a valuable body of knowledge available to a potentially larger audience. Because of its wide coverage, its many illustrations and

other features, and because of the importance of the subjects it treats, *Star Maps* will become an indispensable library accession. It should also be acquired for their own private collections by all of those who are interested in the large and important body of knowledge it covers.

Norman J. W. Thrower
Professor Emeritus
University of California, Los Angeles

Preface to First Edition

In the 17th and 18th Centuries, a number of beautiful sky atlases were produced in Europe that showed the constellations as allegorical representations of classical Greek heroes, heroines, and monsters. But these constellation images also had a scientific purpose, in that they were placed in coordinate systems of celestial latitude and longitude that allowed the stars to be mapped in the sky. In addition, many of these atlases depicted diagrams of the solar system that reflected both contemporary and ancient cosmological systems, thus tracing the development of our view of the heavens over time.

Such images have generally disappeared from modern-day celestial charts, which instead focus on showing thousands of stars and deep-sky objects such as galaxies and nebulae that are not visible to the naked eye. With the discovery of ever more wonders in space and with plans to finish the International Space Station and then move on to explore the Moon and Mars, there is a renewed interest in the heavens. Increasing numbers of people are buying telescopes and becoming amateur astronomers, and they are using star charts to help them navigate in the sky. But, at the same time, the beauty and awe generated by the celestial void has captured our imagination and delighted our aesthetic sense, and there is a longing for the old images. For example, antiquarian map societies are prospering, and celestial maps are now viewed as a specialty of map collecting.

Up until now, discussions of star maps have been found in either general histories of astronomy or in catalogs of celestial atlases that have failed to trace their development over time. What is needed is a more integrated book that discusses celestial cartography in terms of constellation development, changing views of the universe, and advances in mapmaking techniques, while at the same time capturing the beauty of the heavens using images from antiquarian celestial prints and atlases. This, in a nutshell, is the intention of this book.

My decision to write this book is the culmination of a number of factors having to do with my long-standing interests in amateur astronomy (from childhood) and

antiquarian map collecting (from young adulthood). How I got here from there may serve as an example of the appeal of these two activities.

Since the launch of Sputnik I, the world's first artificial satellite, on October 4, 1957, I have been hooked on space. Although I read science fiction novels and joined the space cadet secret decoder club before then, trying to find Sputnik moving through the sky one evening on a bluff overlooking the Willamette River in Portland, Oregon, made me realize that the night sky was pretty interesting. This notion was reinforced by viewing Saturn and its rings through a telescope that someone had set up the same night. Shortly thereafter, I received a 6-cm (2.4-inch) refracting telescope as a holiday present, and I began my 50+ year avocation as an amateur astronomer. Subscribing to *Sky & Telescope* magazine, I looked forward to the monthly star charts in order to see what I could see in the heavens. Although my range was limited, my imagination wasn't, and I dreamed of viewing more of the planets and deep-sky objects that I had been reading about.

This was realized when I finished my schooling and took my first professional job in 1977 as a psychiatry professor at the University of California in San Francisco, a position I still hold. Now, I could afford to buy a larger 20-cm (8-inch) reflecting telescope, and I joined the San Francisco Amateur Astronomers. After my first club "star party" one cold November night on a mountain north of the city, I realized two things: I needed a warmer jacket (even in California), and I needed a good star atlas. I bought a copy of *Norton's Star Atlas*, and I was on my way. As my interests expanded, I bought additional star atlases to help me locate the dim objects I wanted to see. I found these star maps to be fascinating, especially those that showed actual constellation images. I read up on some of the mythology behind the images (mostly from the Ancient Greeks) and imagined being a part of this folklore as I scanned the heavens looking for my deep-sky prey.

While visiting relatives in Rhode Island one summer in 1982, my wife and I chanced upon an antique store in Newport that was displaying two antiquarian constellation prints on a wall. One featured Sagittarius and the other showed a number of constellations around the southern celestial pole. I bought them for a whopping \$24 (total!). I subsequently found out that these prints were from the 1776 French edition of a sky atlas written by John Flamsteed, the first English Astronomer Royal. Several years later in 1989, while on a sabbatical in London, I visited a special exhibit on celestial cartography at the British Museum, and I really became hooked at the beauty and sense of history of these old star maps. Since then, I have continued to acquire antiquarian celestial prints and books. I have joined the California Map Society, the Washington Map Society, and the International Map Collectors' Society (based in London), and I have learned a great deal about collecting old maps through these associations.

But I was frustrated by the fact that there was not a single book on celestial cartography that could inform me about the various aspects of my collecting, such as the meaning behind the squiggly lines that accompanied the epicycles of my

cosmologically oriented charts, who some of the people were who produced the great classical star atlases, how celestial maps evolved and changed over time, ways to protect and preserve them, etc. What I needed was a book that not only was a primer for the collector but also had sufficient reference detail to allow me to identify and understand my maps. Nothing like this appeared, so I decided to write such a book some day.

And here it is, “only” 25 years after I acquired my first antiquarian star maps! This book has been written for three of my alter egos: (1) amateur astronomers who want to know more about star maps and their development, (2) antiquarian map collectors who want to expand their horizons from terrestrial to celestial maps, and (3) people out there who can appreciate the beauty and history behind these wonderful works of art and science and who want to know more about them. I have tried to tell the story of how star maps came into being and evolved over time, as well as to illustrate their artistry through the figures. Except where indicated, all of the images in the book are from the pieces that my wife and I have acquired over the years from here and there. I have digitally photographed nearly all of the illustrations in this book from actual celestial prints, in part to show their diversity, and in part to provide actual examples for the collector who may want to compare his or her prints with someone else’s.

The story of star map development is written and illustrated in the 10 chapters of the book, which may be summarized as follows. Chapter 1 defines the two types of celestial maps: those illustrating cosmological systems, which generally include members of our solar system, and those showing constellation images and the locations of stars in coordinate grids. In addition, this chapter discusses basic orienting concepts that are necessary for the understanding of the maps. Chapter 2 deals with the cosmologies and constellations of four non-European areas that either influenced or were influenced by European star map development: China, Mesopotamia, Egypt, and India. Also in this chapter is a section on ancient astrology. Chapter 3 presents a review of European cosmology from the pre-Socratic philosophers to the time of Newton, with an emphasis on topics relevant to understanding what is shown in the cosmological type of star map (e.g., geocentric versus heliocentric cosmologies, deferents and epicycles). Included are sections on printing and medieval astrology. Chapter 4 traces the development of constellations in Europe, with an emphasis on topics relevant to understanding what is shown in the constellation type of star map (e.g., constellation images depicted at different times in history, currently obsolete constellations). The astronomically sophisticated reader may wish to skip Chapters 3 and 4. However, as in all the chapters, the figures in Chapters 3 and 4 are taken from antiquarian celestial books and prints, so even skimming readers may wish to take a look at them in order to enhance their familiarity with the range of such images.

The text of the remaining chapters deals more specifically with antiquarian celestial maps. Chapter 5 reviews early star maps found in manuscripts and printed works up to 1600. Chapter 6 discusses the Golden Age of pictorial star maps from 1603 to 1801 in Europe, with a special focus on four of the most influential cartographers: Bayer, Hevelius, Flamsteed, and Bode. Chapter 7 continues the

discussion of the Golden Age in terms of other important contributors in Europe. Chapter 8 discusses special topics that are relevant to mapping the heavens: celestial globes and gores, volvelles, astronomical instruments before and including the telescope, and members of our solar system. Chapter 9 focuses on the history of star mapping in early America. Finally, Chapter 10 deals with the transition to star maps without constellation images in the 1800s, and the importance of astrophotography, along with improvements in the graphic arts and computer technology, in producing the star-rich and precise atlases of Norton, Becvar, Tirion, and others up to the present day.

The first four appendices are designed for advanced amateur astronomers, map collectors, and collector-wannabees who wish to know more about the process of collecting and who want a general reference for specific maps that go beyond the material found in the chapters. A glossary and index round out the book.

The legends to the figures contain dimensions in centimeters (cm). This not only gives an indication of the size of the print or page for the general reader, but it also allows collectors to compare their maps with my images to help in establishing authenticity and state of printing. For maps and other images with a border, I have followed the convention of giving the vertical by horizontal dimensions as measured from the inner borderlines. If these don't exist, I have given the height and width of the block mark (for woodblocks) or plate mark (for engravings), or indicated the page dimensions. Where there are hemispheres and planispheres, I have usually given the diameter, again in cm.

It is my hope that this book will stimulate *you* to take a look at the heavens with a new eye, appreciating their scientific wonders for sure, but at the same time seeing the sky as a haven for beauties and beasts of old. You can become a direct participant: economically priced telescopes are available, antiquarian celestial maps can still be found, and there are many amateur astronomy and map-collecting organizations that are ready to help you along the way. Have a pleasant journey!

Nick Kanas
April 2007

To Carolynn, who has joined me in my collecting passion and who has lovingly encouraged me to write this book, even into the wee hours and on sunny days.

Acknowledgments

A book of this type cannot be written in a vacuum, and I would like to thank a number of people for their help and support. First and foremost is my wife Carolynn, who has spent hours looking at celestial prints with me and who has encouraged me to write this book despite its intrusion into our personal time. Andrew and Peter have also been patient over the years hearing about dad's esoteric hobby and listening to explanations about epicycles and cosmologies.

Norman Thrower, Professor Emeritus of Geography (Cartography) at the University of California, Los Angeles, has provided helpful cartographic and editorial advice to an earlier draft of this book, as well as moral support through our mutual association in the California Map Society. Owen Gingerich, Professor Emeritus of Astronomy and History of Science at the Harvard-Smithsonian Center for Astrophysics, has likewise provided helpful editorial suggestions and valuable astronomical advice. Although I have included the suggestions of Professors Thrower and Gingerich in the final version of this book, the responsibility for its content and accuracy remain mine.

Others have helped me in different ways. My friend and fellow celestial map collector, Bob Gordon, has given me moral support, confirmatory information on some questions I had on some of the maps, and digital images of pieces from his wonderful celestial map collection. He has responded graciously to my myriad requests for print dimensions and exact labeling content on some of his maps, and I have appreciated his patience and responsiveness. Peter Barber, Head of Map Collections at the British Library, and his staff have been enormously helpful during my trips to London to research celestial maps and atlases from their vast holdings. Specifically, I would like to thank Nicola Beech, Sue Young, Geoff Amitage, and especially Carlos Corbin for their patience and assistance.

I would also like to mention several people who provided me special assistance in obtaining images for this book: Sandra Powlette at the British Library; Doris Nicholson at the Bodleian Library at Oxford University; Devon Pyle-Vowles

at the Adler Planetarium & Astronomy Museum in Chicago; Stacey McCarroll Cutshaw at the Boston University Art Gallery; Linda Schubert at Rand McNally & Company in Skokie, Illinois; and Jonathan Potter, who kindly provided me with two digital images from his map shop in London and gave me his input on a draft of Appendix A from a dealer's perspective.

I also would like to thank Professor Gingerich, Mr. John Ventre at the Cincinnati Observatory Center, and Mr. Paul Luther at AstronomyBooks in Bernardston, Massachusetts, for providing me with information on O.M. Mitchel's edition of Burritt's book and atlas (see Section 9.6.2 in Chapter 9).

Several of my friends and colleagues in the International Map Collectors Society, the California Map Society, the San Francisco Amateur Astronomers, and the amateur astronomy publication world have also provided me with support and encouragement in writing this book. Some have served as referees of my book proposal and provided helpful advice. I would especially like to thank the following: Robert Clancy, Susan Gole, David Kalifon, Hans Kok, Joshua Roth, Phil Simon, and James C. White.

Clive Horwood, my publisher at Praxis Publishing Ltd. in Chichester, England, has been very supportive during the process of producing this book, and as an author juggling a number of competing projects and struggling with deadlines, I have appreciated his patience. Neil Shuttlewood, whose company Originator Publishing Services in Norfolk, England, has been responsible for the copyediting, has been very responsive to my questions about digital photography and page proof production. Finally, Rhea Siegel, Esq., at Springer Publications in New York, has given me helpful advice about permissions and copyrights.

Unless otherwise indicated, the figures in this book have been produced from digital photographs taken from antiquarian books and prints that are part of the Nick and Carolyn Kanas Collection. Permissions to use and photograph the images from other sources have been obtained, and these sources are acknowledged in the legends to the figures. Every effort has been made to source the original copyright holders, and I apologize to any that I may have missed through oversight or inability to contact via e-mail or phone.

Figures

(boldface indicates page numbers of color versions in the Color Plate Gallery)

1.1	View of several northern constellations	2, 374
1.2	A plate produced by Doppelmayr for Homann Publications, ca. 1720 . . .	4, 375
1.3	An image from the first American edition of Flammarion’s <i>Popular Astronomy</i>	6
1.4	A figure of an armillary sphere	9
1.5	View of the north pole	11, 376
2.1	The Chinese northern circumpolar constellations	21
2.2	A diagram of the 28 Chinese lunar mansions	22
2.3	The 12 Chinese constellations of the zodiac	26
2.4	Drawing of a ceiling painting from a temple at Thebes	30
2.5	Chromolithograph of an Egyptian papyrus “Judgment of the Dead”	31, 377
2.6	A pull-out plate of the plan of the temples at Karnak	33
2.7	Copper schematic engraving of the famous “Dendera zodiac” planisphere at the Temple of Hathor at Dendera	36
2.8	The 27 <i>naksatra</i> constellations from Vedic mythology	39, 378
2.9	Indian constellations	41
2.10	“Planisphere Egyptien” representing the Egyptian sky	43, 379
2.11	A figure from Charles-François Dupuis’ <i>L’Origine de tous les Cultes ou Religion Universelle</i>	44, 380
3.1	An illustration of the sphericity of the Earth	53
3.2	A plate showing the orbit of the Sun around the central Earth according to Hipparchus and adapted by Ptolemy	59, 381
3.3	A figure from Sir Robert Ball’s <i>The Story of the Heavens</i>	60
3.4	An illustration explaining the retrograde motion of an outer planet in the sky	61
3.5	A figure from Sir Robert Ball’s <i>The Story of the Heavens</i>	63
3.6	An illustration of the Aristotelian/Ptolemaic cosmological system that was used in the Middle Ages	64
3.7	An outer planet’s orbit according to Ptolemy	66
3.8	Anonymous calendar leaf for October from a <i>Book of Hours</i> , ca. 1350 . .	70, 382
3.9	The planetary model of Ptolemy for Mercury	72

3.10	Copper engraving from the first printed Ottoman Turkish world atlas . . .	74, 383
3.11	A page from a 13th-Century Byzantine manuscript	76
3.12	A nativity horoscope produced in 1421 for King Henry VI of England . .	81
3.13	An engraved plate from the first Dutch edition (1682) of <i>Mundus Subterraneus</i>	83, 384
3.14	Woodcut illustration depicting the 7th day of Creation.	88
3.15	Page from the 1533 edition of Apian's <i>Cosmographia</i>	90
3.16	Image from the 1894 American edition of Flammarion's <i>Popular Astronomy</i>	93
3.17	Print entitled "Le Nom de Système", from Le Rouge's <i>Atlas Nouveau Portatif à L'Usage des Militaires et du Voyageur</i>	95, 385
3.18	Print entitled "Motus Planetarum Superiorum Qui Secundum Tychonis Hypothesin.	97, 386
3.19	Copper engraving from Bion's <i>L'Usage des Globes Célestes et Terrestres</i> .	100, 387
4.1	A pull-out plate showing the northern celestial hemisphere	112
4.2	A pull-out plate showing the southern celestial hemisphere	113
4.3	The constellation of Argo Navis, from Firmicus Maternus' <i>Scriptores Astronomici Veteres</i>	115
4.4	Two constellations from a manuscript copy of al-Sufi's <i>Book of Fixed Stars</i>	116, 388
4.5	The southern celestial hemisphere ("Hemisphere Austral") centered on the south equatorial pole.	120, 389
4.6	The northern celestial hemisphere ("Hemisphere Boreal") centered on the north equatorial pole.	122, 390
4.7	Lacaille's famous map of the south celestial polar region	125, 391
4.8	"Fig. Q." constellations from Hevelius' <i>Firmamentum Sobiescianum, sive Uranographia</i>	127
4.9	A section of the hemisphere centered around the first point of Aries	130, 392
5.1	The constellation of Aries, from a 10th-Century manuscript written on vellum	134, 393
5.2	The constellation of Aquarius, from Hugo Grotius' <i>Syntagma Arateorum Opus Poeticae et Astronomiae</i>	135
5.3	The constellation of Cetus, from Firmicus Maternus' <i>Scriptores Astronomici Veteres</i>	137
5.4	The northern celestial hemisphere produced by Albrecht Dürer in 1515 . .	139, 394
5.5	The northern celestial hemisphere produced by Johannes Honter in 1541. .	141, 395
5.6	The constellations of Ursa Minor and Ursa Major.	144
5.7	The constellation of Andromeda, reproduced from Galluci's 1588 <i>Theatrum Mundi</i>	145
5.8	The northern celestial hemisphere of Hood's 1590 <i>The Use of the Celestial Globe in Plano</i>	147, 396
6.1	A later-colored image of the constellation Bootes, from a mid-1600 edition of Bayer's <i>Uranometria</i>	154, 397
6.2	The Christianized constellation St. Sylvester (a.k.a. Bootes), from the 1627 edition of Schiller's <i>Coelum Stellatum Christianum</i>	157, 398
6.3	The verso of the print shown in Figure 6.2, giving the title and star table for the next constellation in the atlas	158
6.4	The constellation of Libra, the only zodiacal constellation that is not a person or animal, from Bevis' <i>Atlas Céleste</i>	161, 399
6.5	The northern celestial hemisphere from Hevelius' <i>Firmamentum Sobiescianum</i>	165, 400

6.6	“Fig. F.” constellations from Hevelius’ <i>Firmamentum Sobiescianum, sive Uranographia</i>	166
6.7	The northern celestial hemisphere from Zahn’s <i>Specula Physico-Mathematico-Historica</i>	167, 401
6.8	The southern celestial hemisphere from Zahn’s <i>Specula Physico-Mathematico-Historica</i>	168, 402
6.9	The double-hemisphere map from Schenck’s <i>Atlas Contractus</i>	169, 403
6.10	The map labeled “Monoceros, Canis Major & Minor, Navis, Lepus”, from Flamsteed’s <i>Atlas Coelestis</i>	174, 404
6.11	The map showing the region around Monoceros (the unicorn), from Reissig’s <i>Constellations Represented on XXX Tables</i>	178, 405
6.12	The constellations around the location of the Sun in the zodiac at the time of the autumnal equinox, from the 1833 edition of <i>The Constellations</i>	179, 406
6.13	The constellations for “Julius” (July), from a ca. 1787 edition of Bode’s <i>Anleitung zur Kenntniss des Gestirnten Himmels</i>	181, 407
6.14	Plate III showing Perseus and Andromeda, from the 1782 edition of Bode’s <i>Vorstellung der Gestirne</i>	182, 408
6.15	The hemisphere Coelum Stellatum Hemisphaerium Arietis, centered around the location of the Sun in the zodiac at the time of the vernal equinox, from Bode’s 1801 <i>Uranographia</i>	184, 409
6.16	Plate XXV featuring the region of Monoceros, Canis Major and Minor, from Jamieson’s 1822 <i>A Celestial Atlas</i>	186, 410
6.17	An original hand-painted card of the constellation “Orion”, from a later edition (ca. 1840) of Leigh’s <i>Urania’s Mirror</i>	187, 411
6.18	Plate XII featuring the region around Orion, from Riedig’s <i>Stern-Karten in 20 Blättern</i>	189, 412
7.1	A diagram showing the orbit of the Moon around the Earth according to Ptolemy, from Cellarius’ <i>Harmonia Macrocsmica</i>	192, 413
7.2	A diagram showing a planisphere centered on the north ecliptic pole down to about 20 degrees in the southern hemisphere, from Cellarius’ 1660 edition of <i>Harmonia Macrocsmica</i>	193, 414
7.3	An engraved plate from the first Dutch edition (1682) of <i>Mundus Subterraneus</i>	197
7.4	A print from Mallet’s 1683 <i>Description de l’Univers</i>	198, 415
7.5	A double print from Coronelli’s <i>Corso Geografico Universale</i>	200, 416
7.6	A double hemisphere from Coronelli’s <i>Globi Differenti del P. Coronelli</i>	202, 417
7.7	A double hemisphere from Seller’s <i>Atlas Coelestis</i>	204, 418
7.8	One of two pages depicting the zodiac in three long horizontal strips, produced by Senex in 1718.	206, 419
7.9	The constellation of Canis Major, from Thomas’ 1730 <i>Mercurii Philosophici Firmamentum</i>	208, 420
7.10	The stars and constellations that are centered around the location of the Sun in the zodiac during the winter solstice, according to Doppelmayr	210, 421
7.11	The southern hemisphere constellations, from Zatta’s 1779 <i>Atlante Novissimo</i>	212, 422
7.12	The northern celestial hemisphere, from Dunn’s 1774 <i>A New Atlas of the Mundane System</i>	213
7.13	The depiction of three important globes (“La Sphère Artificielle”), from Nicolas de Fer’s 1703 <i>L’Atlas Curieux</i>	215, 423
