

BestMasters

Sven Painer

Variation Based Dense 3D Reconstruction

Application on Monocular
Mini-Laparoscopic Sequences

BestMasters

Springer awards „BestMasters“ to the best master's theses which have been completed at renowned universities in Germany, Austria, and Switzerland.

The studies received highest marks and were recommended for publication by supervisors. They address current issues from various fields of research in natural sciences, psychology, technology, and economics.

The series addresses practitioners as well as scientists and, in particular, offers guidance for early stage researchers.

Sven Painer

Variation Based Dense 3D Reconstruction

Application on Monocular
Mini-Laparoscopic Sequences

With a preface by Prof. Dr.-Ing. Rolf-Rainer Grigat

Sven Painer
Hamburg, Germany

Awarded with the Fokusfinder Preis 2015 of Initiative Bilderverarbeitung e.V. and the Karl H. Ditze Preis 2015 of Hamburg University of Technology.

Institute Profile

The research focus of TUHH Vision Systems, a research group of Hamburg University of Technology, is on image analysis and pattern recognition, both in basic research and its transfer to industrial applications.

Examples of our research expertise are three-dimensional geometric reconstruction from video sequences (3D Computer Vision), color management and multispectral modeling, camera calibration and camera characterization, medical image analysis, and methods for classification, detection and parameter estimation. Methods are related to mathematics, physics, communications engineering, microelectronics and computer science.

Selected application fields are 3D modeling of surfaces, self-calibration of cameras, reconstruction of indoor scenes featuring only sparse or no texturing, inverse problems in medicine, joint segmentation in x-ray images, optimal color reproduction, and low-level algorithms for mobile phone cameras.

Preface

3D modeling of cirrhotic liver surfaces based on laparoscopic videos will render possible the quantification of fibrosis in almost real-time. Up to now, qualitative and verbal descriptions as well as video documentations had to be used.

Origin was the research of Dr.-Ing. Jan Marek Marcinczak, who has been supervising and supporting Mr. Painer's Master Thesis. During his PhD research Mr. Marcinczak has estimated the camera motion and the geometry of the organ surface based on complete video sequences [13]. His methods work off-line and non-causal. Based on this work, Mr. Painer has developed a causal method, which basically works on-line and in real-time.

Mr. Painer parallelized the algorithms and proved the performance of his implementation. He adjusted the methods for the complete reconstruction, consisting of a sparse reconstruction via Structure from Motion and a dense reconstruction via a variational approach, and embedded these into a software framework designed entirely by himself.

The computationally intensive dense reconstruction has been parallelized by Mr. Painer using CUDA and a self-designed class library to be executed on the graphics card. This class library takes care of clearing resources after usage to prevent resource leaks in the context of CUDA. The implementation takes only 55 seconds for the reconstruction of 30 frames consisting of sparse and dense reconstruction. Previous, non-causal algorithms required 30 minutes for the reconstruction.

Mr. Painer's Master Thesis has been awarded the Fokusfinder Preis 2015 of Initiative Bilderverarbeitung e.V. and the Karl H. Ditze Preis 2015 of Hamburg University of Technology.

The topic was motivated by Prof. Dr. Ansgar W. Lohse, Medical Director of I. Department of Internal Medicine of Universitätsklinikum Hamburg-Eppendorf (UKE). The cooperation has been accompanied by PD Dr. Ulrike Denzer, Dr. Julian Holzhüter and Dr. Tobias Werner of UKE. We cordially appreciate their cooperation.

Mr. Painer has skillfully solved all mathematically sophisticated difficulties during his Master Thesis and provided a scalable concurrent implementation, which can basically be executed in real-time on an adequate hardware platform. The result paves the way for supporting the clinicians both on-line during video capturing and for quantitative documentation. The feedback during the intervention can help improving the quality of the videos and the subsequent reconstructions. I hope for a positive response and a broad audience of this work.

Prof. Dr.-Ing. Rolf-Rainer Grigat
TUHH Vision Systems
Hamburg University of Technology

Acknowledgements

I would like to thank my supervisor Dr.-Ing. Jan Marek Marcinczak for guiding me through my work. I would not have come so far without your friendly and competent help. You will be an example for me on how to supervise people.

I would also like to thank Prof. Dr.-Ing. Rolf-Rainer Grigat for giving me the chance of writing this thesis and for all the experiences I was able to gain throughout the time.

A special thank goes to all people of the TUHH Vision Systems institute for the nice working atmosphere. It was a pleasure spending the time with you.

If there are only a few mistakes in this thesis, it is because of the great support by Pia Beilfuß and Michael Garben. Thank you for proofreading this thesis.

Last but not least, I would also like to thank my family for the great support. Without you I would not be where I am today and without you I would not have written this thesis. Thank you very much!
