# About the Authors

**RODNEY LANDRUM** is a senior SQL Server DBA and author living in Pensacola, Florida. He writes regularly for *SQL Server Magazine*, Simple Talk (http://www.simple-talk.com), and SQLServerCentral.com. When not writing T-SQL queries or covering his geek arm with SQL and Atari tattoos, he can be glimpsed speaking at his hometown SQL users group meetings or other regional and national technology conferences. He has been working with SQL Server technologies since 1995.

**SHAWN MCGEHEE** is a former developer currently working as a DBA for a national health and life insurance company in Pensacola, Florida that specializes in managed care products. He is an active member in the Pensacola SQL Server Users Group where he speaks regularly at meetings. Some of his other writing can be seen on popular SQL sites such as SQLServerCentral.com and Simple Talk.

**WALTER J. VOYTEK III** (Jim) is the CEO and president of HealthWare Corporation, a Microsoft Gold Certified Partner, which specializes in information technology solutions for the post-acute health-care industry, including home health and hospice. He has worked in information technology for more than 30 years and in health-care IT for over 20 years. He speaks publicly on both technology and health-care and also represents HealthWare in a variety of settings each year. As the founder and CEO of HealthWare, Jim has been instrumental in the design and development of HealthWare's industry-leading applications for the health-care industry.

# **About the Technical Reviewer**

**FABIO CLAUDIO FERRACCHIATI** is a senior consultant and a senior analyst/developer of Microsoft technologies. He works for Brain Force (http://www.brainforce.com) in its Italian branch (http://www.brainforce.it). He is a Microsoft Certified Solution Developer for .NET, a Microsoft Certified Application Developer for .NET, and a Microsoft Certified Professional, as well as a prolific author and technical reviewer. Over the past ten years he's written articles for Italian and international magazines and coauthored more than ten books on a variety of computer topics. You can read his LINQ blog at http://www.ferracchiati.com.

## Acknowledgments

**O**f the many people I would like to thank for their encouragement and patience during the writing of this third edition of *Pro SQL Server 2008 Reporting Services*, foremost is Karla Kay, my fiancée, my angel, my FP, my love, who has been there throughout, and I can never thank her enough. I would like to also thank all of my youngins, Brendan, Ethan, Megan, and Taylor, for their love and understanding and for stealing me away to see a movie or catch pin fish when I should have been writing. I must mention my parents, of course, Faye and Gene, whose pride and expectation of a novel will be rewarded. I love you both. Thanks go also to Jim (Walter) Voytek for his technical support, friendship, and raised glasses of cold beer. Finally, I would like to thank Shawn McGehee for taking on the coding and writing challenges for his part of this edition.

Rodney Landrum

would like to thank my coauthor and SQL mentor, Rodney Landrum, first and foremost. Without his guidance over the past few years, I would not have been granted the opportunity to work on this book with him, an experience I would not trade for anything in this world. He is always a pleasure to work with and has taught me more in the time we have spent together than I would have ever thought possible. After this experience, I don't just consider him my mentor, but gladly call him my friend.

I would also like to give an enormous thank you to my family. When I was growing up, my career goal had always been concrete in my mind: I was going to be a doctor. As long as I could remember, my dream of being a doctor never strayed from my thoughts. This plan, however, fell through as soon as my father, Harold, and mother, Barbara, brought home our first family computer. From the second I began tinkering and playing with the old IBM desktop, I knew that my future had changed. And, even though my mother didn't want her 10-year-old installing the optional 300 baud modem, she and my father fully supported my zeal for technology from the start. Without my family I would be lost. I love you all immensely.

To all my friends who at times I feel I have abandoned during this process: thank you for understanding that chapter deadlines and conference calls have to come before spending a weekend out of town.

A big thank you goes to all of the staff at Apress who have pushed and prodded us through this book. Thank you for understanding as we sat in "hurry up and wait" mode, anxiously awaiting the latest version of the product to be released. Thank you for pushing us through the deadlines and long nights to get the book finished on time. The road was a rough one, but made a lot smoother by all of the great people at Apress.

Shawn McGehee

xviii

would like to thank Rodney, my coauthor on the first two editions, because without him I would not have been involved with this book at all. We have been colleagues for many years, and it has been a pleasure working with him. Having already written another book with Rodney and knowing the quality of his writing, doing this book with him was an easy choice.

I would also like to thank my father, who introduced me to the world of electronics when I was still very young. His interest in digital electronics would prove to be the spark that set me on my path to a career in information technology. I remember so clearly the day he brought a book home called *Digital Computers Made Simple*. I read it and thought to myself how exciting it was that a machine could be built and programmed to do so many different things. I could see so many possibilities, and at that point I knew I was hooked.

My first exposure to computer technology started about the time the Intel 8008 became available. With my father's help, I was able to procure one of these early microprocessors, and it became the basis for the first microcomputer I ever built. Using these early technologies, I built and entered several computer systems in science-fair projects throughout my high-school years, eventually competing at the international level.

My corporate career began early when I started my first company while still in high school. Today I am the CEO of HealthWare Corporation, a company that provides information technology to the health-care field. I am also partners in several other businesses with interests ranging from technology to real estate.

I would like to thank my wife, Kathi, who has put up with the long hours that it took to write the book. She is a wonderful companion who understands me well and always provides support and encouragement for any endeavor I undertake.

I would also like to thank my mother, who encouraged me all those years in school when I was participating in science fairs. Thanks to my sister, who always tells me she gave up her computer technology genes so I could have them. And to the rest of my family, friends, and colleagues who supported me and my wife, Kathi, throughout the process of writing this book.

A very big thank you goes to HealthWare Corporation and all of its employees and customers. They have been instrumental in my career and have provided inspiration for writing the book.

Thanks also go to Apress and the wonderful people involved with this project for their important roles in getting this book to print: lead editor Jonathan Gennick; project manager Sofia Marchant; technical reviewer Fabio Claudio Ferracchiati; copy editor Ami Knox; production editors Laura Cheu and Kelly Gunther; indexer Kevin Broccoli; proofreader Liz Welch; compositor Susan Glinert Stevens; and any others involved with their important roles in getting this book to print.

Special thanks go to Tom Rizzo, the SQL Server product manager at Microsoft, for answering many questions for us during the course of our writing and for putting us in contact with other resources within Microsoft when needed.

Walter J. Voytek III

# Introduction

At its core, the process of designing reports hasn't changed substantially in the past 15 years. The report designer lays out report objects, which contain data from a known data source, in a design application such as Business Objects Reports or Microsoft Access. He or she then tests report execution, verifies the accuracy of the results, and distributes the report to the target audience.

Sure, there are enough differences between design applications to mean that the designer must become familiar with each particular environment. However, there's enough crossover functionality to make this learning curve small. For example, the SUM function is the same in Business Objects Reports as it is in Microsoft Access as it is in Structured Query Language (SQL).

With Microsoft SQL Server 2005 Reporting Services (referred to as SSRS throughout the book), there is, again, only a marginal difference in the way reports are designed from one graphical report design application to another. So, if you do have previous reporting experience, your learning curve for SSRS should be relatively shallow. This is especially true if you come from a .NET environment, because the report designer application for SSRS is Visual Studio 2008 or the application included with SQL Server 2008, Business Intelligence Development Studio (BIDS).

Having said all this, several differences set SSRS apart from other reporting solutions:

- It provides a standard reporting platform based on Report Definition Language (RDL), which is the XML schema that dictates the common structure of all SSRS reports. This allows for report creation from any third-party application that supports the RDL schema.
- SSRS is an integral part of the SQL Server 2008 release.
- SSRS offers features out of the box that in other products would be expensive additions to a basic deployment. These features include subscription services, report caching, report history, and scheduling of report execution.
- SSRS, being a Web-based solution, can be deployed across a variety of platforms.

This book was written in parallel with a real SSRS deployment for a health-care application, so it covers almost every design and deployment consideration for SSRS, always from the stand-point of how to get the job done effectively. You'll find step-by-step guides, practical tips, and best practices, along with code samples that you'll be able to modify and use in your own SSRS applications.

### What This Book Covers

From designing reports and stored procedures in Chapters 2–4, to deployment, management, and security processes in Chapters 6–9, the book uses a standard real-world theme to show how we chose to work with SSRS. Throughout, you'll find tips and tricks that we discovered while working closely with SSRS. The book also covers extending SSRS functionality with custom code in Chapter 5. In addition, we will demonstrate almost all the enhancements that are included with the SQL Server 2008 version of SSRS, including Tablix properties, rich text support with HTML tags, and an entire chapter devoted to ad hoc or user-developed reporting with Report Builder 1.0 and Report Builder 2.0. In addition, we will cover SharePoint integration with SSRS, not just with SharePoint Report Viewer Web Parts, but also with a full-blown SharePoint deployment.

The following is a chapter-by-chapter breakdown to give you a feel for what the book covers:

**Chapter 1, "Introducing the Reporting Services Architecture"**: This chapter introduces SSRS and discusses some of the driving forces behind our company's adoption of this technology. We then take a detailed look at the component pieces of the SSRS architecture, including Report Manager, BIDS, and the SSRS report server and databases. We describe how these work together to provide an effective reporting solution. We also highlight all the new features and enhancements to the latest version of SSRS for SQL Server 2008. We finish with installation and configuration instructions.

**Chapter 2, "Report Authoring: Designing Efficient Queries"**: The foundation of any report is the SQL query that defines the report data. In this chapter, we examine the query development process and show how to build and test high-performance queries for business reports. We also show how to encapsulate such queries in parameterized stored procedures to benefit from precompilation and reuse.

**Chapter 3, "Introduction to Reporting Services Design"**: This chapter explores BIDS in detail, demonstrating the use of all the major embedded elements of SSRS within that environment. It shows how to create data sources; explains how to add report parameters, filters, and expressions; and provides an in-depth look at the layout section for report design.

**Chapter 4, "Building Reports"**: Having covered query and report design basics, we now walk you through the process of building a full business report, including interactive features such as document maps, hyperlinks, and bookmarks.

**Chapter 5, "Using Custom .NET Code with Reports"**: This chapter shows you how to customize your reports using .NET code, either by embedding Visual Basic .NET code directly in your report or by using a custom .NET assembly. We discuss and demonstrate each technique and its pros and cons.

**Chapter 6, "Rendering Reports from .NET Applications"**: This chapter shows how to control the rendering of your reports programmatically in a variety of supported formats, either via URL access or by using the Web services API.

**Chapter 7, "Deploying Reports"**: SSRS provides several means of deploying reports: using the Report Manager interface, using VS .NET, using the rs command-line utility, or writing code using the Web services API. This chapter demonstrates and explains each of these techniques.

**Chapter 8, "Managing Reports"**: This chapter examines the many facets of SSRS report management, including content management, performance monitoring, report execution auditing, and control. It shows how to perform each of these tasks effectively, using built-in tools such as Report Manager, the new Report Server Configuration Manager, and command-line utilities, as well as using custom .NET management tools.

**Chapter 9, "Securing Reports"**: This chapter introduces several important components of SSRS security, namely, data encryption, authentication and user access, and report auditing. This chapter also shows how to use each of these components in a secure SSRS deployment.

**Chapter 10, "Delivering Business Intelligence with SSRS**": In our work, we found that by integrating SSRS with many of the other components of the business intelligence (BI) platform, we were able to provide all the necessary information to our employees wherever they were and whenever they needed it, thus dramatically improving our overall business strategy. In this chapter, we demonstrate how we set about integrating SSRS with BI components, Microsoft Office SharePoint Services (MOSS), and Analysis Services.

**Chapter 11, "Creating Reports Using Report Builder 1.0 and 2.0"**: In the final chapter, we demonstrate the much anticipated Report Builder 2.0 application, a report development application for end users that has the same look and feel of Microsoft Office. We also demonstrate Report Builder 1.0, originally released with SQL Server 2005. This ad hoc report design tool uses report models, which we also show how to create and deploy.

In each chapter, we've tried to touch on every aspect of SSRS in enough detail to allow you to translate the concepts into your own applications. Our intention was to provide truly practical, useful information on every page and not to parrot material that's adequately covered in Books Online (BOL). To that end, concepts such as cascading parameters and designing reports with hierarchical data using the LEVEL function aren't covered, because you can find adequate explanations and working examples in BOL.

We believe this book will serve as both an introduction and a step-by-step guide through many common tasks associated with SSRS, while also offering concepts and solutions that we've been developing ourselves for our own applications.

### Who This Book Is For

We coauthored the book with the intention of demonstrating how to use SSRS from multiple vantage points. As a data analyst and engineer, Rodney goes through the report design and deployment processes using standard SSRS tools such as Report Designer in BIDS and Report Manager. As a .NET developer, Shawn takes on the role of showing how other developers can extend SSRS by creating custom Windows and Web Forms applications, as he explains the SSRS programming model.

### **Source Code**

In this book, we use a subset of a real database designed for a health-care application that we developed. You can find that prepopulated database (which we named Pro\_SSRS, for the book), the data mart database and cube file used in Chapter 10, the completed RDL files, queries, stored procedures, and .NET application projects, as well as full installation instructions, in the Source Code/Download section of the Apress Web site (http://www.apress.com).

### CHAPTER 1

### Introducing the Reporting Services Architecture

When Microsoft announced in 2003 that it was going to release SQL Server Reporting Services (SSRS) as a SQL Server 2000 add-on, a frenzy of excitement ensued. The product was originally slated for release with SQL Server 2005, so the early release was a welcome event for many. Our software development company decided to embrace SSRS early on and was fortunate to work with Microsoft during the beta phases. In January 2004, the month SSRS was released to manufacturing (RTM), we deployed it immediately. We intended to migrate all of our existing reports (which had been developed on as many as five reporting applications and platforms over the past ten years) to SSRS. We can sum up the reason for the seemingly rapid decision in one word: *standardization*.

Just as Microsoft wanted to create an industry standard with Report Definition Language (RDL), the Extensible Markup Language (XML) schema that dictates the common structure of all SSRS reports, we wanted to provide a standard reporting solution to our customers. Even in the first version of the product, SSRS delivered almost all the features we needed. Thanks to its extensibility via SSRS's Web service, we could programmatically add other features that weren't already directly supported. In addition, Microsoft was committed to enhancing SSRS over time. Even prior to SSRS for SQL Server 2005 (SS2005), Microsoft provided valuable enhancements such as client-side printing in service pack releases.

That brings us to present day, to the SSRS enhancements that have been incorporated into the long-awaited release of SQL Server 2008. SSRS has taken its place as a key component in the latest release of SQL Server and can no longer be thought of as just an add-on. The new features in SSRS 2008 push the technology one step further into becoming the reporting development environment of choice for programmers and designers, especially those who are already skilled with Visual Studio (VS) and Visual Basic .NET (VB .NET). Like with its predecessor, SSRS 2005, the long-awaited features for SSRS 2008 are mostly driven by direct feedback from the user community. Throughout the book, we will demonstrate each of these new features as we show how to design professional reports, applications, and solutions built on Microsoft's business intelligence (BI) initiatives. Throughout the book, we will focus on SSRS as a whole, building on features from each version from 2000 to 2008; however, we will notate which features are new to SSRS 2008.

### Understanding the Benefits of SSRS

The decision of our company to migrate immediately to SSRS was based on the following perceived benefits for the company and for our customers:

*Standard platform*: In addition to providing a standard realized with the RDL, our development teams had been using VS .NET as their main development environment. Because SSRS reports were currently developed within this platform, we wouldn't need to purchase additional development software. Our clients would need to purchase only a low-cost edition of a designer—VB .NET, for example—to gain the benefit of developing custom reports themselves. In SQL Server 2005, Microsoft included the Business Intelligence Development Studio (BIDS) as a free, alternative report designer. This free development environment is also available with SQL Server 2008, based on the next edition of Visual Studio, VS 2008. Report designers who learn to design reports with BIDS have the advantage of moving to the full version of Visual Studio anytime with no additional training.

*Cost*: SSRS is an integral part of SQL Server 2008 and is available in many editions, from Express to Enterprise. When you purchase SQL Server, you get SSRS as well.

*Web-enabled*: Because SSRS is a Web-based reporting solution, a single deployed report is accessible to a variety of clients, from the browser to custom Windows Forms. Also, because reports are primarily accessed via Hypertext Transfer Protocol (HTTP) or HTTP Secure (HTTPS), you can view reports from any location that has access to the SSRS Web server, which no longer requires reports to be installed locally with heavy client applications.

*Customizable*: SSRS provides a .NET Web service as a front end and as such can be accessed programmatically to extend the delivery of reports beyond the browser. As .NET programmers, we knew we would want to build custom applications to render reports where we could control the look and feel of the report viewer. We show one such application in Chapter 6, which covers report rendering.

*Subscriptions*: Having the ability to deliver reports through e-mail or a file share and processed during off-peak hours, which was offered with SSRS subscription abilities, was a huge advantage for our company and our clients. We show how to set up two different kinds of subscriptions, standard and data-driven, in Chapter 8.

As you'll see, SSRS is a full reporting solution that encompasses many levels of professional expertise, from report design to database administration. In many organizations, especially small- to medium-sized ones, information technology (IT) professionals are asked to perform many jobs. They write a query and design a report in the morning, perform database backups or restores in the afternoon, and update all the systems before heading home in the early evening.

Fortunately, during external deployment of SSRS to our clients and internal deployment for my software development company, I (Rodney) have worn each of these hats on a day-today basis. I have been entrenched in every deployment phase. By developing efficient stored procedures, designing reports, testing security, and maintaining deployed reports as a content manager, I have witnessed the day-to-day operation of SSRS from many perspectives.

In addition to those roles, I have also been responsible for our company's overall strategy for building solutions to analyze and transform the data that's gathered through both our own and other third-party applications. To that end, an essential part of my job was integrating SSRS into the overall BI strategy that incorporated the following:

- Disparate data sources such as Analysis Services Cubes and SQL Server relational databases
- · Applications and tools such as Microsoft Excel and Business Scorecards
- · Document management systems such as Microsoft SharePoint Portal Server

We'll dive into the details of such integration projects in Chapter 10, which is devoted to BI, and explore one of the key advancements of SSRS 2008, which is a tighter integration with SharePoint portal server, to the point that SSRS content can now be directly deployed, managed, and viewed all with SharePoint.

SSRS represents another world—a world that an administrator who uses standard management tools doesn't typically witness. That is the world of the software developer who can extend and control SSRS programmatically, building custom report viewers and deployment applications. In this book, as you work through each step of building a reporting solution for health-care professionals, we'll demonstrate how an administrator can accomplish the task with built-in tools, as well as how a developer can create an application to provide enhanced functionality.

#### SSRS IN CONTEXT: GREEN BAR, ANYONE?

Before we begin our breakdown of the overall SSRS platform, I (Rodney) will share a personal experience that illustrates one of the many challenges that SSRS addresses. That is, the story shows that creating an environment where the method in which the data is delivered to users is often as crucial as the data itself. Users want easy and fast access to data in an intuitive but powerful interface. SSRS overcomes this challenge of changing the way users work by delivering reports in applications that are already familiar to most users: browsers and e-mail clients.

Jumping back in time a few years—well, 15 years—when I started down the path of what is now described correctly as IT, I took a job as an intern in the government sector. I should have known by the *Data Processing Center* banner over the door to my interviewer's office that I wasn't exactly stepping into the modern digital age. I was offered the lowly position of mainframe computer operator, which I took eagerly despite knowing I would be eating boiled eggs and tomato soup for the foreseeable future. On the first day, I was introduced to two assemblages of technology that my father, who also worked in data processing (DP), introduced me to in the early 1980s: a vault full of reel-to-reel magnetic tapes and box after box of green bar paper. In time I came to both appreciate and loathe the rote task of, every night, printing thousands of pages of reports that I knew would only be scanned by a few people and then discarded. I say that I appreciated the task because every so often I would be visited by a programmer who wrote one of the reports. We'd talk about the time it took to write the report, why he constantly had to update the reports, and who was asking for the updates (typically a high official). We would also commiserate about the fact that generating such a report each night was a complete waste of valuable resources. I could only hope he meant me.

One day I heard a rumor that my beloved Data Processing Center was going to be absorbed by another government body. I learned, as many did, that sweeping changes would affect my position. New supervisors came in and surveyed the inherited archaic technology landscape. What happened was astounding in many regards. The banner over my former boss's door was the first to be altered; with the stroke of a paintbrush we were now *Information Resources*. The new regime didn't think "computer operator" was a good title for me anymore. In less than the time it takes to print 3,000 checks, I became a "data specialist," and I could now eat spaghetti with real meat sauce.

I bided my time, awaiting a new system that would mean I could take the reins in my new administrative position and stop hauling the green bar. A new system was duly purchased, and I was elated. Finally, I thought, they'll bring in a modern networked system that will have online report delivery technologies. On the day the hardware was delivered, I looked in awe at my—technically, their—new IBM RS6000. Fortunately for everyone except me, the new printer that was delivered accepted the same green bar paper that we had stockpiled for years to come!

This story demonstrates that often the benefits of new technologies go unrealized because of the habitual nature of the workers who are forced to adopt that new technology. Users who relied on the Data Processing Center were used to receiving their 200-page reports each morning and tossing them by noon. If the reports weren't discarded, they were bound, bundled, and hauled to the basement for future reference. It had been done that way for years. It seemed that only the people who appreciated the work that went into the reports—the programmers and computer operators—understood the ridiculousness of the practice.

In the ensuing years, I had a number of positions, all of which involved delivering data in myriad reporting technologies, using a plethora of data stores. One day it was scrubbing data from Indexed Sequential Access Method (ISAM) files; the next day saw me pulling data from a Unix-based Oracle database. With the blessing of Open Database Connectivity (ODBC), data was accessible in almost any format.

Eventually I began work with Microsoft SQL Server 6.5 and have remained there through versions 7.0 and 2000. Over the latter years, Microsoft released a variety of applications that made my job significantly easier while offering much in the way of data delivery. A notable example was the introduction of Online Analytical Processing (OLAP) Services in 7.0, which became Analysis Services in 2000. However, one item that always seemed just out of reach was a client application that could be used to effectively deliver the data contained within these new technologies. Sure, Excel could tap into OLAP cubes, and Data Analyzer was a promising addition, but these were expensive applications that required local installations. Surely a Web-enabled reporting application would be available soon, right?

This brings me to the present, where SSRS is now in its third major revision with SQL Server 2008 and holding its own as a prime contender in the reporting market space. Through colleagues, newsgroups, and personal experience, I can see that SSRS has been adopted by many companies, often replacing existing reporting solutions altogether. I also realize that resistance to change is as strong as ever for many others. As someone who has been working with SSRS now for nearly 4 years, watching it mature, I have heard some of the reasons why managers and developers are reluctant to move to fully move to SSRS. One reason, a valid one, is that it is difficult to find report developers who have both business-specific knowledge, such as accounting, and proven SSRS development skills. Most business analysts designing reports, it is argued, are familiar with other reporting technologies, like Business Objects, so it is often easier for a company, despite the cost, to purchase the reporting solution that the ones who will be designing reports know how to use. Although this is not always the case-often companies will invest in retraining-this is one argument I have heard. Other reasons for not adopting SSRS are for specific features that do not exist or if they do, they are often lacking certain critical components. One of these limitations has been offline reporting, or the ability to view reports without being connected to the IIS Reporting Services Web front end. There are myriad other features that users have wanted. Microsoft does listen to these feature requests as is evidenced by the many updates that SSRS has seen over the years. SSRS 2008 will further deliver necessary features that will break down more barriers for user acceptance. We will cover these new features in the next section and in detail throughout the book.

### **SQL Server 2008 Reporting Services Enhancements**

The following are the most significant enhancements made to the SSRS technology in SQL Server 2008.

#### **Report Builder/Data Modeler**

The Report Builder application, a feature introduced in SSRS 2005, is a local, ad hoc, reportdesigning application that is intended to be used more by report consumers than by report developers. The business logic and underlying data structures are created as a data model by an administrator who is familiar with the source data. With the Report Builder application, the user can create and publish reports based on available models. Report Builder 1.0, as well as the new Report Builder 2.0, based on Microsoft Ribbon technology, has been enhanced significantly in SSRS 2008, providing a richer development environment and additional content sources, such as Oracle and Analysis Services Cubes. Chapter 11 covers how to build and deploy a data model as well as create reports with the Report Builder 1.0 and Report Builder 2.0 applications.

#### Integrating SSRS 2008 with Microsoft Office SharePoint

While SharePoint integration has been available with the use of SharePoint controls in previous versions of SSRS, SSRS 2008 takes the integration several steps further. By using SSRS 2008 in SharePoint Integration Mode, it is possible to deploy, manage, and deliver reports and report objects, like data sources and models, all within the SharePoint environment. Entire dashboards or portals can be created using SSRS reports within SharePoint. In addition, the deployed reports inherit the native features of SharePoint, such as the ability to check in and check out reports, report change notification, and workflow capabilities. We will demonstrate this tighter integration with SharePoint in Chapter 10.

#### Introducing the Tablix Report Properties

As the name suggests, the new Tablix properties in SSRS 2008 are a combination of two existing controls, Table and Matrix. By combining these two report controls, developers now have a more flexible tool when creating reports with multiple columns and rows that blends the static nature of the Table control and the dynamic nature of the Matrix. Now it is possible to have a report that can accommodate multiple parallel rows and column members at each level, independent of each other but using the same aggregate calculations. In previous editions of this book, we provided workarounds to combining tables and matrices by embedding one within the other. We will now explore the true power of the new Tablix control properties for the List, Table, and Matrix controls in Chapter 4.

#### **Enhanced Charting Visualizations**

From the beginning, SSRS offered charts and visualizations natively in reports. These charts, while versatile, were somewhat limited in scope. Much or all of the functionality in the charting aspects of previous versions of SSRS could be easily duplicated in Microsoft Excel. In fact, the charting was almost identical. In SSRS 2008, there are several charting and graphical data visualization enhancements that are key to a sound BI reporting solution, which SSRS surely is a pivotal component of. New charting elements such as range, polar, radar, funnel, and pyramid are available as well as many new "gauges" delivered with the acquisition of Dundas reporting

controls for SSRS. We will explore several of these new visualizations as we incorporate them into reports in Chapter 4.

#### **Enhanced Performance and Memory Management**

The report engine in SSRS 2008 has been reengineered to lessen the memory footprint for reports at the server level, speeding delivery of reports to end-user applications. This enhancement also resolves contention with long-running, large reports with other smaller, non-memory-bound reports processing simultaneously.

#### **Embeddable SSRS Controls**

The ability to embed controls in custom applications makes it easier for developers to integrate SSRS into their projects. SQL Server 2008 includes updated freely distributable controls that you can use for Windows Forms development and ASP.NET Web Forms development. These controls provide additional benefits to developers, such as the ability to render reports while disconnected from the SSRS. We will cover updated SSRS controls in Chapter 6.

#### **HTML Text Formatting**

Aside from the ability to export to Microsoft Word in SSRS 2008, text formatting is probably one of the most significant advancements to SSRS. In previous versions of SSRS, in-line formatting of textual content, such as a form letter, was not possible. SSRS 2008 report textboxes can now be formatted as you would in any word processor. The text formatting can combine both literal text and data source text for mail merge and template reports. We will demonstrate how to fully utilize this feature by creating a custom form letter style report in Chapter 4.

#### Exporting to Microsoft Word

Since the first version of SSRS, you could export any report to Microsoft Excel. While this was an important capability, not being able to export to other Microsoft Office formats, such as Word, was a limitation. Many reports that developers are asked to create require rich texts formats found in today's modern word processors. By combining the features of SSRS to design custom reports from multiple data sources with the richness of Microsoft Word formatting, SSRS 2008 has finally overcome a significant limitation.

#### SSRS and Business Intelligence

Because SSRS is but one component of Microsoft's BI platform, we'll now cover other new features and enhancements to SQL Server 2008 that will form an integral part of your overall reporting solution.

#### Business Intelligence Development Studio (BIDS)

BIDS is a limited version of Visual Studio 2008 that is included with the SQL Server 2008 base installation. With BIDS, developers can create entire projects for each of the supported components of SQL Server 2008, including SQL Server Integration Services (SSIS), SQL Server Analysis Services (SSAS), and of course SSRS. We will use BIDS throughout the book to show how to design and deploy SSRS reports and Analysis Services projects.

#### SQL Server Management Studio (SSMS)

With SQL Server 2008, Microsoft continues to build on its management platform with SQL Server Management Studio (SSMS). Microsoft has taken a big step toward consolidating within one environment many of the tools that in previous versions of SQL Server would have been executed individually. SSMS replaces Enterprise Manager and Query Analyzer, offering a much more elaborate set of tools for creating and managing SQL Server objects and queries. In addition to managing SQL Server and Analysis Services servers, administrators can use SSMS to manage instances of their SSRS reporting servers.

We will show how to use both SSMS and Report Manager throughout the book for different tasks. We will show how to use SSMS, for example, to test query performance. In addition, we will show you how to use the browser-based Report Manager to view published reports, set security permissions, and create subscriptions. Both applications share functionality for managing SSRS; however, Report Manager is often preferable to SSMS because it does not require a local installation. You can access Report Manager from a browser anywhere on your network. You would need to have access to the installed SQL Server 2008 client tools in order to use SSMS.

### **Exploring the SSRS Architecture**

You've probably heard the expression that the devil is in the details. You'll be drilling into those details throughout the book, right down to the data packets that SSRS constructs, as you explore each aspect of SSRS from design to security. For now, let's pull back to a broader vantage point—the 10,000-foot view—and look at the three main components that work together to make SSRS a true multitier application: the client, the report server, and the SQL Server report databases. Figure 1-1 shows the conceptual breakdown of the three component pieces.

Here, the data source and the SSRS databases, ReportServer and ReportServerTempDB, are separate entities; the data source is the origin of the data that will populate the reports; and the report server databases store information about the reports. Both the data source and the report server databases can physically be located on the same SQL Server, assuming the data source is a SQL Server database. The data source can be any supported data provider, such as SQL Server, Oracle, Lightweight Directory Access Protocol (LDAP), or Analysis Services. It's possible to configure a single server to act as both the SSRS report server web service and report server database as well as the data source server. However, this isn't recommended unless you have a small user base. We'll show how to monitor the performance of the SSRS configuration and build a small Web farm, post-installation, in Chapter 8.

Figure 1-1. SSRS components

#### SSRS Databases

The SSRS installation creates two databases:

ReportServer: This is the primary database that stores all the information about reports that was originally provided from the RDL files used to create and publish the reports to the ReportServer database. In addition to report properties (such as data sources) and report parameters, ReportServer also stores folder hierarchy and report execution log information.

ReportServerTempDB: This database houses cached copies of reports that you can use to increase performance for many simultaneous users. By caching reports using a nonvolatile storage mechanism, you make sure they remain available to users even if the report server is restarted.

Database administrators can use standard tools to back up and restore these two databases. An additional database might be added after the initial installation of SSRS: the RSExecutionLog database. This database stores more discernable information about report execution, such as the user who ran the report, the time of execution, and performance statistics. We'll cover creating the RSExecutionLog database and discuss report execution logging in detail in Chapter 8.

#### The SSRS Report Server

The SSRS report server plays the most important role in the SSRS model. Working in the middle, it's responsible for every client request to render a report or to perform a management request, such as creating a subscription. You can break down the report server into several subcomponents by their function:

- Programming interface
- Authentication Layer (new to SSRS 2008)
- · Report processing
- · Data processing
- · Report rendering
- · Report scheduling and delivery

#### SSRS Web Service Interface

The programming interface, exposed as .NET Web service application programming interfaces (APIs) and uniform resource locator (URL) access methods, handles all incoming requests from clients, whether the request is a report request or a management request. Depending on the type of request, the programming interface either processes it directly by accessing the ReportServer database or passes it off to another component for further processing. If the request is for an on-demand report or a snapshot, the Web service passes it to the ReportProcessor before delivering the completed request to the client or storing it in the ReportServer database.

**Note** On-demand reports are ones that are rendered and delivered directly to the client, while snapshots are reports that are processed at a point in time and delivered to the client through e-mail or via file shares, or (if configured) directly to a printer.

#### Authentication Layer

SSRS 2005 relied heavily on the authentication methodology of IIS, since SSRS and IIS were interdependent. SSRS 2008 is no longer tied to IIS; instead, it uses HTTP.SYS directly as well as SQL Server's native network components, and as such, SSRS's architecture has been redesigned to include its own authentication layer, which we will cover in Chapter 9.

#### **The Report Processor**

The Report Processor component is responsible for all report requests. Like the programming interface, it communicates directly with the Report Server database to receive the report definition

information that it then uses to combine with the data returned from the data source, which is accessed via one of the data processing extensions.

#### **Data Processing**

SSRS supports four data processing extensions to connect to data sources. These are SQL Server, Oracle, OLE DB, and ODBC. When the data processing component receives the request from the Report Processor, it initiates a connection to the data source and passes it the source query. Data is returned and sent back to the Report Processor, which then combines the elements of the report with the data returned from the Data Processor extension.

#### **Report Rendering**

The combined report and data is handed off to the rendering extension component to be turned into one of several supported formats, based on the rendering type specified by the client (we cover rendering in depth in Chapter 6):

- *HTML*: Default rendering format, supporting HTML versions 4.0 and 3.2.
- *Portable Document Format (PDF)*: Format used to produce print-ready reports using Adobe Acrobat Reader. SSRS doesn't require that you have an Adobe license to render in PDF, which is a great benefit to customers. All you need is a PDF reader.
- Excel 2002 and 2003: Service Pack 1 of SSRS supports Excel 97 and later.
- *XML*: Other applications or services can use reports that are exported to XML.
- *Comma-separated values (CSVs)*: By rendering to a CSV file, you can further process the report by importing it into other CSV-supported applications such as Microsoft Excel.
- *MIME HTML (MHTML)*: You can use this format, also known as a *Web archive*, to deliver reports directly in e-mail or to deliver them for storage, because the report contents, including images, are embedded within a single file.
- *Tagged Image File Format (TIFF)*: Rendering image files using TIFF guarantees a standard view of the report, as it's processed the same way for all users despite their browser settings or versions.
- Microsoft Word: Standard Microsoft Word document export is now included in SSRS 2008.

#### Scheduling and Delivery

If the request from the client requires a schedule or delivery extension, such as a snapshot or subscription, the programming interface calls the Scheduling and Delivery Processor to handle the request. You can generate and deliver report snapshots based on a user-defined or shared schedule to one of two supported delivery extensions: an e-mail or a file share. Note that SSRS uses the SQL Server Agent to create the scheduled job. If the SQL Server Agent isn't running, the job won't execute. We'll cover creating subscriptions and snapshots based on shared schedules in Chapter 8.

### **Client Applications**

SSRS includes several client applications that use the SSRS programming interface, namely, its Web service APIs, along with URL access methods to provide front-end tools for users to access both SSRS reports and configuration tools. These tools provide report server management, security implementation, and report-rendering functionality. The tools are as follows:

- *Report Manager*: This browser-based application ships with SSRS and provides a graphical interface for users who need to view or print reports or to manage report objects for their workgroups or departments. We cover Report Manager in detail in Chapter 8, which covers managing SSRS.
- *BIDS*: This tool provides an integrated environment for developing SSRS reports. We introduce BIDS in Chapter 3 and step through building reports in this environment in Chapter 4.
- *Command-line utilities*: You can use several command-line tools to configure and manage the SSRS environment, including rs, rsconfig, and RSKeyMgmt.
- *Custom clients*: These VB .NET Windows Forms and Web applications call the SSRS Web service to perform such tasks as rendering reports and managing report objects. SSRS includes sample application projects that you can compile and run to extend the functionality provided by the main tools listed earlier. In Chapters 6 and 7 we show how to develop your own custom applications: a report viewer and a report publisher.
- *Reporting Services Configuration Manager*: SSRS for SQL Server 2008 includes an enhanced Reporting Services Configuration Manager designed specifically to change many of these properties in a graphical environment, including setting the SSRS environment up for offline or disconnected reporting.

When thinking of a Web-based application, the natural inclination is to think *Web browser*. Even though other front-end tools, such as SSMS and BIDS, connect to the report server, a Web browser plays an important role in providing the graphical interface for users. They can use Report Manager to view or print reports or remotely manage the report server for their work-groups or departments.

#### **Report Manager**

Within Report Manager, users can render reports, create report subscriptions, modify the properties of report objects, and configure security, as well as perform a host of other tasks. Users can access Report Manager by simply opening their Web browser and navigating to a URL of the form http://Servername/Reports. Figure 1-2 shows Report Manager in action, with a listing of reports in a folder deployed specifically for clinicians.

Figure 1-2. The Web-based Report Manager application

#### **Business Intelligence Development Studio (BIDS)**

The browser is only one of several clients that can use the SSRS Web service. In fact, BIDS is a client when it interacts with the Web service to deploy reports and data sources. BIDS offers a graphical design environment that report developers use to produce the RDL files that SSRS uses for deploying and rendering reports.

**Note** Because RDL is a defined standard, you can use any design application that supports the creation of RDL files. Other third-party report designers are available, and many more are forthcoming.

By defining the base URL and folder name in a BIDS report project, you can deploy the RDL files that are created directly to the report server while in design mode. The base URL is of the form http://Servername/ReportServer. We'll cover the entire BIDS design environment in Chapter 3, including most available report objects. We'll also describe the RDL schema that defines every aspect of an SSRS report. Figure 1-3 shows the BIDS design environment, also called an integrated development environment (IDE), with a report loaded in design mode.

Figure 1-3. BIDS environment

#### **Command-Line Utilities**

In addition to graphical applications such as BIDS and SSMS, SSRS provides several commandline utilities that are considered Web service clients. The tools have the added benefit of being automated by using built-in task scheduling in Windows. SSRS includes four main commandline utilities:

- rs: Processes report services script (RSS) files that are written with VB .NET code. Because you can access the full SSRS API via the code in the script, all SSRS Web service methods are available.
- rsconfig: Configures the authentication methods and credentials for how SSRS connects to the ReportServer database. rsconfig also sets the unattended SSRS execution credentials for SSRS.
- rskeymgmt: Manages the encryption keys that SSRS uses to store sensitive data securely, such as authentication credentials. Chapter 9 covers how to use rskeymgmt.

#### **Custom Clients**

The final types of clients are those custom designed to access the SSRS Web services. We've built several such applications for our own company, such as a report viewer and report publisher. Third-party commercial applications exist that provide extended functionality. One such client, the new Report Builder application, is a good example of building not just a report-rendering form but an entire design application that connects directly to the report server and can be installed using standard ClickOnce technologies from within the browser.
