Manufactured in the United States of America

## *Dedication*

**Joe Stockman:** To my mom and all my friends and family who supported me — and left me alone — during this project.

**Alan Simpson:** To Susan, Ashley, and Alec, as always.

## *Authors' Acknowledgments*

Even though only two authors' names appear on the cover, every book is a team project. These authors would like to thank the many people who contributed to this book. To Carole McClendon and everyone at Waterside Productions, thank you for finding this project and making it happen. Also, many thanks to Kyle Looper and Jean Rogers at Wiley for taking a chance on a new author to help with the rewrite. And also, thanks to Microsoft for making Access a wonderful development environment.

# *About the Author*

**Joe Stockman** is an independent consultant, software designer, and author who has been using Microsoft Access since its initial release. He's also developed courseware and taught classes in Access and VBA. Joe developed his first application in Access, and then migrated into Visual Basic and VB.NET, where he specializes in creating applications for the Windows Mobile platform. He worked for several software companies before forming his consulting business in 2002, where he deals with all types of clients including healthcare, financial, government, manufacturing, and small business. His ability to turn his customers' wishes into working applications keeps them satisfied. Joe's also writing the fundamentals column for the *Advisor Guide to Microsoft Access* magazine.

**Alan Simpson** is the author of over 100 computer books on databases, Windows, Web site design and development, programming, and networking. His books are published throughout the world in over a dozen languages and have millions of copies. Alan has also taught introductory and advanced computer programming courses at San Diego State University and the UCSD Extension. He has served as a consultant on high-technology, education-oriented projects for the United States Navy and Air Force. Despite that, Alan has no fancy job title because he has never had a real job.

## **Publisher's Acknowledgments**

We're proud of this book; please send us your comments through our online registration form located at [www.dummies.com/register/](http://www.dummies.com/register/).

Some of the people who helped bring this book to market include the following:

### ***Acquisitions, Editorial, and Media Development***

**Associate Project Editor:** Jean Rogers

*(Previous Edition: Christopher Morris)*

**Acquisitions Editor:** Kyle Looper

**Copy Editor:** Becky Whitney

**Technical Editor:** Russ Mullen

**Editorial Manager:** Kevin Kirschner

**Media Development Specialists:** Angela Denny,  
Kate Jenkins, Steven Kudirka, Kit Malone

**Media Development Coordinator:**  
Laura Atkinson

**Media Project Supervisor:** Laura Moss

**Media Development Manager:** Laura VanWinkle

**Media Development Associate Producer:**  
Richard Graves

**Editorial Assistant:** Amanda Foxworth

**Sr. Editorial Assistant:** Cherie Case

**Cartoons:** Rich Tennant  
([www.the5thwave.com](http://www.the5thwave.com))

### ***Composition Services***

**Project Coordinator:** Jennifer Theriot

**Layout and Graphics:** Carl Byers,  
Stephanie D. Jumper, Barbara Moore,  
Barry Offringa, Alicia B. South

**Proofreaders:** Techbooks, Brian H. Walls

**Indexer:** Techbooks

**Anniversary Logo Design:** Richard Pacifico

Web Site for This Book .....	5
Where to Go from Here.....	5
<b><i>Part 1: Introducing VBA Programming</i></b> .....	<b>7</b>
<b>Chapter 1: Where VBA Fits In</b> .....	<b>9</b>
Taking a Look at Access .....	10
Understanding VBA.....	11
Seeing Where VBA Lurks.....	12
Finding standard modules.....	13
Finding class modules .....	13
From VBA to Access.....	15
Finding Out How VBA Works .....	17
Discovering VBA procedures.....	17
Recognizing VBA procedures.....	18
<b>Chapter 2: Your VBA Toolkit</b> .....	<b>21</b>
Using the Visual Basic Editor.....	21
Using Project Explorer.....	23
Using the Properties window.....	24
Using the Immediate window.....	26
Using the Code window .....	27
Referring to Objects from VBA.....	29
Setting References to Object Libraries.....	30
Using the Object Browser .....	30
Searching the Object Library .....	33

**Chapter 3: Jumpstart: Creating a Simple VBA Program . . . . . 35**

Creating a Standard Module .....	35
Creating a Procedure .....	36
Understanding Syntax .....	38
Getting keyword help .....	40
Help with arguments .....	43
About named arguments .....	45
Using Existing Code .....	46
Copy and paste code from the Web .....	46
Importing modules .....	47
Modifying existing code .....	48

**Part II: VBA Tools and Techniques ..... 49****Chapter 4: Understanding Your VBA Building Blocks . . . . . 51**

Commenting Your Code .....	52
Understanding VBA Data Types .....	53
Passing Data to Procedures .....	54
Storing data in variables and constants .....	57
Storing data in arrays .....	58
Module-level versus procedure-level .....	60
Naming conventions for variables .....	61
Repeating Chunks of Code with Loops .....	62
Using Do...Loop to create a loop .....	62
Using While...Wend to create a loop .....	64
Using For...Next to create a loop .....	64
Making Decisions in VBA Code .....	66
Using If...End If statements .....	67
Using a Select Case block .....	68

**Chapter 5: Controlling Access through VBA . . . . . 71**

Understanding Object Models .....	72
Distinguishing between objects and collections .....	72
Understanding properties and methods .....	75
Identifying the icons for objects, properties, and methods .....	77
Manipulating Properties and Methods .....	79
Getting the value of a property .....	79
Changing the value of a property .....	81
Using an object's methods .....	82
Seeking help with properties and methods .....	84

**Chapter 6: Programming Access Forms . . . . . 87**

Working with Class Procedures .....	87
Enabling or Disabling Form Controls .....	90
Using VBA to position the cursor .....	91
Choosing an object and event for the code .....	92

Showing and hiding controls .....95  
 Making controls read-only.....96  
 Responding to Form Events.....96  
 Changing the Appearance of Objects .....99  
     Changing colors .....99  
     Controlling boldface, italics, and such .....103  
     Changing special effects .....104  
     Using the With...End With statements .....104  
     Filling form controls with data .....105  
 Opening and Closing Forms.....107  
     Closing a form .....109  
     Adding a related record to another table.....109  
     More DoCmd methods for forms.....112

***Part III: VBA, Recordsets, and SQL..... 115***

**Chapter 7: The Scoop on SQL and Recordsets .....117**

What the Heck Is SQL?.....117  
     Writing SQL without knowing SQL .....120  
     Select queries versus action queries .....121  
     Getting SQL into VBA .....123  
     Hiding warning messages .....124  
     Storing SQL statements in variables .....125  
 Creating Tables from VBA .....128  
     Creating new tables from existing tables .....128  
     Creating a new, empty table from VBA .....129  
     Closing and deleting tables through VBA .....130  
 Adding Records to a Table .....131  
     Appending a single record with SQL.....132  
     Query to append one record .....133  
 Changing and Deleting Table Records.....134  
 Performing an Action Query on One Record.....136  
 Working with Select Queries and Recordsets.....137  
     Defining a connection .....140  
     Defining the recordset and data source .....141  
     Filling the recordset with data.....142  
     Managing recordsets .....143  
     Referring to fields in a recordset.....145  
     Closing recordsets and collections .....146

**Chapter 8: Putting Recordsets to Work .....147**

Looping through Collections .....147  
     Using For Each loops .....149  
     Using shorter names for objects .....152

Tips on Reading and Modifying Code.....	154
Square brackets represent names.....	154
Other ways to refer to objects.....	155
The continuation character.....	157
Skipping Over Used Mailing Labels.....	159
Looking at How SkipLabels Works.....	162
Passing data to SkipLabels.....	164
Declaring variables.....	165
Copying the label report.....	165
Getting a report's recordsource.....	165
Creating the recordset.....	166
Creating LabelsTempTable from MyRecordSet.....	166
Calling a Procedure from an Event.....	171

## ***Part IV: Applying VBA in the Real World..... 173***

### **Chapter 9: Creating Your Own Dialog Boxes ..... 175**

Displaying and Responding to Messages.....	176
Asking a question.....	176
Designing a message box.....	177
Responding to a MsgBox button click.....	180
Converting Forms to Dialog Boxes.....	182
Storing dialog box settings.....	183
Setting form properties.....	184
Adding controls to the dialog box.....	187
Creating Custom Combo Boxes.....	189
Creating a Spin Box Control.....	195
Detecting a Right-Click.....	198

### **Chapter 10: Customizing Combo Boxes and List Boxes ..... 201**

Programming Combo and List Boxes.....	202
Listing field names.....	204
Listing text options.....	207
Listing Table/Query field values.....	212
Linking Lists.....	216
Running code when a form opens.....	218
Running code when the user makes a choice.....	219
Linking Lists across Forms.....	222
Updating a combo box or a list box.....	223
Opening a form to enter a new record.....	225
Seeing whether a form is open.....	226
Getting forms in sync.....	227
More Combo Box Tricks.....	228
Using hidden values in combo and list boxes.....	228
Giving users a quick find.....	232
Avoiding retyping common entries.....	235

<b>Chapter 11: Creating Your Own Functions</b> .....	<b>239</b>
The Role of Functions in VBA.....	239
Creating Your Own Functions.....	241
Passing data to a function.....	242
Returning a value from a function.....	243
Testing a custom function.....	244
A Proper Case Function.....	245
Looking at how PCase() works .....	247
Using the PCase() function .....	248
A Function to Print Check Amounts .....	251
Using the NumWord function.....	254
Looking at how NumWord() works .....	256
<b>Chapter 12: Testing and Debugging Your Code</b> .....	<b>265</b>
Understanding Compilation and Runtime .....	266
Considering Types of Program Errors .....	268
Conquering Compile Errors.....	269
Expected: expression.....	271
Expected: end of statement .....	272
Expected: list separator or ) .....	272
Dealing with Logical Errors.....	274
Checking on variables with Debug.Print .....	275
Slowing down code .....	279
Getting back to normal in the Code window .....	282
Wrestling Runtime Errors.....	283
Responding to a runtime error .....	283
Trapping runtime errors.....	285
Writing your own error handlers.....	288
 <b>Part V: Reaching Out with VBA</b> .....	 <b>293</b>
<b>Chapter 13: Using VBA with Multiple Databases</b> .....	<b>295</b>
Client-Server Microsoft Access .....	296
Importing from External Databases.....	302
Linking to External Data through Code.....	304
Avoiding Multiple Tables and Links.....	305
Creating Recordsets from External Tables .....	308
Importing, Exporting, or Linking to Anything .....	309
Using a macro to write the code .....	309
Quick and easy import/export/link.....	312
<b>Chapter 14: Integrating with Other Office Applications</b> .....	<b>315</b>
Accessing the Object Library .....	315
Exploring a program's object model.....	317
Meet the Application object.....	318
Connecting to other programs .....	319

Sending E-Mail via Outlook .....	320
Sending Data to Microsoft Word .....	325
Creating the Word template .....	325
Creating the Access form .....	327
Writing the merge code .....	328
Interacting with Microsoft Excel .....	334
Creating the worksheet.....	335
Creating a query and a form .....	336
Writing the Excel code.....	337
Copying a table or query to a worksheet.....	342
Running Excel macros from Access .....	346

## ***Part VI: The Part of Tens*.....349**

### **Chapter 15: Ten Commandments of Writing VBA . . . . . 351**

I. Thou Shalt Not Harbor Strange Beliefs about Microsoft Access .....	351
II. Thou Shalt Not Use VBA Statements in Vain .....	351
III. Remember to Keep Holy the VBA Syntax .....	352
IV. Honor Thy Parens and Quotation Marks .....	353
V. Thou Shalt Not Guess .....	354
VI. Thou Shalt Not Commit Help Adultery.....	354
VII. Thou Shalt Steal Whenever Possible .....	355
VIII. Thou Shalt Not Bear False Witness against Thy Object Browser .....	355
IX. Thou Shalt Not Covet Thy Neighbor's Knowledge.....	356
X. Thou Shalt Not Scream .....	356

### **Chapter 16: Top Ten Nerdy VBA Tricks . . . . . 357**

Open a Form from VBA.....	357
See Whether a Form Is Already Open.....	358
Refer to an Open Form .....	358
Move the Cursor to a Control.....	359
Change the Contents of a Control.....	360
Update a List Box or Combo Box.....	360
Show a Custom Message.....	361
Ask the User a Question.....	362
Print a Report .....	363
Get to Know the DoCmd Object .....	364

## ***Index*.....367**

# Introduction

---

**W**elcome to *Access 2007 VBA Programming For Dummies*. As you already know (we hope), Microsoft Access is a huge database management program, offering lots of ways to manage data (information). Common uses of Access include managing mailing lists, memberships, scientific and statistical data, entire small businesses, and just about anything else that involves storing and managing large amounts of information.

As the title implies, this book is about using Visual Basic for Applications (VBA) to enhance the power of Access databases. If you want Access to print words on a check, skip mailing labels that you've already used, or manipulate data behind the scenes, you have to write VBA code.

By the time you finish this book, you should know exactly what VBA is all about and how it fits into Access. You'll discover the meanings of all those obscure terms that programmers throw around — code, variable, array, loop, object — as though they were common knowledge. You'll be able to write and use your own, custom code, just like advanced programmers do.

This book covers VBA in Access 2007. Although many changes and improvements to Access have occurred in all the versions that Microsoft has released, the VBA programming language has hardly changed a bit over the years. Although Access 2007 looks completely different from previous versions, the underlying objects are virtually unchanged. The code that you see in this book should also work in Access 2000, 2002, and 2003. The vast majority of the code in this book also works just fine even in last century's versions, such as Access 97.

## *About This Book*

We wish we could say that this book is exactly like a coffee-table book, where you could just pick it up, flip to any page, and have everything make perfect sense to you. Well, we *could* say that, but we'd be lying if we did. It's not because we want to break from the coffee-table book idea. It's really more because some stuff in life doesn't make much sense until after you already know something else.

Here, it isn't really possible to make much sense of VBA code until you understand what VBA code is and why it exists. And, we are talking about Microsoft Access VBA here. To make sense of much of anything in this book, you have to already be familiar with Microsoft Access tables, queries, forms, and reports. We just don't have enough room in this book to explain all that stuff from scratch and still have enough pages left over to talk about VBA.

On the bright side, we did everything we could to make it easy to find what you need to know, when you need to know it. You certainly don't have to read this book from cover to cover to make sense of things. After you find the topic you're looking for, you should be able to read through the section and be done with it quickly. Often, you can skip reading sections altogether and get all you need to know from looking at the figures.

## *Conventions Used in This Book*

While we're on the topic of using this book without boring yourself to death by attempting to *read* it, we also stuck with some conventions for displaying text in these pages. For example, any VBA programming code appears in a monospace font with a gray background, like this:

```
'VBA code to say Hello World on the screen.  
Sub Hello()  
    MsgBox "Hello World"  
End Sub
```

When we have just a little chunk of code to show in text, like this — `Dim Wit As Date` — you can see what is and what isn't VBA code.

The ⇨ symbol that you see in text separates individual menu options (commands) that you choose in sequence. For example, rather than say “Choose New from the File menu” or “Click File on the menu bar and then click New on the drop-down menu,” we just say

Choose File⇨New from the menu bar.

When you see something **in bold**, we want you to enter (type) it.

## *What You're Not to Read*

Not many people in the world would put reading a computer book into the Read for Fun category. We think that reading a computer book is more likely to fall into the Read for Work or Don't Read category. To minimize the time

---

you have to spend away from the fun stuff, we put some information in sidebars and beside Technical Stuff icons. That information is definitely optional reading that you're welcome to ignore.

## *Foolish Assumptions*

To stay focused on VBA in this book, we need to assume that you're already familiar with Access and that you're comfortable creating tables, forms, reports, and queries. However, we don't assume that you're a true Microsoft Access expert. Let's face it: Access isn't exactly an easy program for most people to tackle.

Another assumption we make is that you have already created an Access database with at least some tables and forms in it. In fact, writing VBA code is usually the last step in creating a custom Access database.

Finally, we don't assume that you're already an accomplished programmer who is just picking up a new programming language. Rather, we assume that you've never written any programming code in your life — and maybe you aren't even all that sure what programming code means or how it relates to Microsoft Access.

## *How This Book Is Organized*

All books contain a lot of information. That's what makes them books. To break down topics into smaller, more manageable chunks, we split this book into six main parts.

### *Part I: Introducing VBA Programming*

This part has all the information you need to get started. If you've already been using VBA for a few months or years, you can skim this part. If you don't know a VBA procedure from a PTO meeting, you might want to take a closer look at Part I before venturing forth to other parts.

### *Part II: VBA Tools and Techniques*

Here you discover how to write VBA code to make Access do things for you. For example, you'll see how you can make Access open forms, respond to button clicks, change the appearance of objects, and more.

## ***Part III: VBA, Recordsets, and SQL***

Here you get friendly with tools and techniques for managing your Access tables by using VBA with SQL (Structured Query Language) and recordsets. All those buzzwords make this process sound more technical than it really is. But as you'll see, if you've done anything at all with queries, you've already been working with SQL recordsets. The idea is the same. We just use fancier terminology in the VBA world.

## ***Part IV: Applying VBA in the Real World***

In this part, you get into some more advanced programming tricks, mostly by using techniques presented in earlier parts in new and creative ways. You'll also see how to use the VBA debugging techniques, which can be real life-savers when things go wrong and you just can't figure out why the code you wrote isn't doing what you intended.

## ***Part V: Reaching Out with VBA***

VBA isn't a programming language solely for Microsoft Access. You can also use VBA to customize all the Microsoft Office application programs, including Word, Excel, and Outlook. Furthermore, VBA can import data from, and export data to, a variety of formats that extend its reach even beyond Microsoft Access. Part V shows you how that's all done.

## ***Part VI: The Part of Tens***

What *For Dummies* book would be complete without a Part of Tens? Ten is such a nice number to work with, given our ten fingers and all. Chapter 15 covers the main strategies that you can adopt to avoid going crazy trying to get VBA to do your bidding. Chapter 16 goes over the top ten nerdy programming tricks you're most likely to want to do almost from your first day of using VBA.

## ***Icons Used in This Book***

As you flip through this book, you'll notice little icons sprinkled throughout its pages. These icons, as described here, point out little chunks of text that deserve either a little extra attention or very little attention:

Tips point out handy tricks or techniques that can make things easier for you when you're working with VBA.

These icons point out techniques that, if you do things wrong, might create problems. If you pay attention to the Warnings we give, you can avoid making common blunders.

These icons point out tools and techniques that you'll use often as you work with VBA. Keep them in mind.

These icons point out text that describes how or why a thing works the way it does from a technical standpoint. If you just want to get a thing to work and don't care about how or why it works, you can always skip these.

## Web Site for This Book

If you can find a way to copy and paste — rather than type — VBA code into your database, go for it. Much of the sample VBA code shown in this book is the kind of thing you can just drop into an Access database and start using. There's no need to retype the whole thing. Anyway, we post all the useful code at this Web site:

[www.dummies.com/go/access2007vbaprogram](http://www.dummies.com/go/access2007vbaprogram)

When you get to the site, you'll see where to find the code and how to copy and paste it into your own database, and find a link where you can send us your questions.

## Where to Go from Here

Now that you know what this book is about and how it's organized, the next question is "Where do I start?" Your best bet, if you're an absolute VBA beginner, is at Chapter 1. Try to slog through the first three (short) chapters to get your bearings.

Experienced VBA users can probably start anywhere that looks interesting. If you get in over your head at some point, watch for cross-references to earlier chapters where you can quickly fill in the knowledge gap that's causing the confusion.

# 6

## Access 2007 VBA Programming For Dummies ---

# Part I

# Introducing VBA Programming

The 5<sup>th</sup> Wave

By Rich Tennant

“Once I told Mona that Access was an ‘argument’ based program, she seemed to warm up to it.”

## *In this part . . .*

**V**BA lets you do some pretty amazing stuff in an Access database. With VBA, you can make Access do boring, repetitive jobs that you might otherwise have to do on your own. You can even get Access to do things that it couldn't possibly do on its own. Before you dive right in and try to make such things happen, you need to step back a moment and get a feel for how VBA fits into the whole Microsoft Access scheme of things. Then you need to get friendly with the tools available to you for turning ideas into stuff that actually happens when you want it to happen. We lead you through all of that in Chapters 1 and 2.

With your road map and tool kit in hand, you'll be ready to get into what Access VBA is really all about — writing code (also known as programming) — to make Access do exactly what you want it to do. Yes, you write code by simply typing it, unless, of course, you can just copy and paste the code, as is often the case. Chapter 3 talks about both writing and swiping VBA code.

# Chapter 1

## Where VBA Fits In

---

### *In This Chapter*

- ▶ Describing Access
  - ▶ Discovering VBA
  - ▶ Seeing where VBA lurks
  - ▶ Understanding how VBA works
- 

**T**his book is about using *Visual Basic for Applications (VBA)*, which is a programming language that helps you program, tweak, and squeeze productivity from Access. VBA, which is embedded in Access, is a sophisticated set of programming tools that you can use to harness the power of a packaged application like Access. Just like you need to know how to walk before you can run, you need to know how to use Access before you can start to use Access VBA.

Maybe you want to use Access to manage a large mailing list. Maybe you need Access to manage your whole business, including customers, products, and orders. Perhaps you need to manage enrollments in courses or events. Whatever your reason for using Access, your first step is always to create the tables for storing your data. From there, you can then create queries, forms, reports, and macros to help manage that data. All these steps take place before you even get into VBA, so in this book we have to assume that you're already an experienced Access user who needs more than what queries, forms, reports, and macros can provide. If you're new to Access, this book isn't a good place to start. If you need to brush up on Access, *Access 2007 For Dummies* (by John Kaufeld, Laurie Ulrich Fuller, and Ken Cook; Wiley Publishing) or *Access 2007 All-in-One Desk Reference For Dummies* (Alan Simpson, Margaret Levine Young, and Alison Barrows; Wiley) is a good place to start.

Although Access has progressed through many versions over the years, VBA has remained relatively unchanged. We used Access 2007 to create this book, but the code examples we present should work fine in just about any version of Access. So now, before launching into VBA, take a moment to delve into what tables, queries, forms, and reports are all about, and how VBA fits into the overall scheme of things.

## Taking a Look at Access

Access, part of the Microsoft Office suite, is a huge database management system that you work with by using modern object-oriented methods. (The term *object-oriented* stems from the fact that everything you create in Access — a table, form, report, or whatever — is considered an object.

The Access Navigation pane, as shown in Figure 1-1, is the main container in which you store all the main objects that make up a single database. The Navigation pane breaks down the objects into groups — tables, queries, forms, and so on — and each group contains the objects within that group. The following list summarizes the types of objects.

**Figure 1-1:**  
The Access  
Navigation  
pane.

Groups      Navigation pane

- ✓ **Tables:** *Tables* contain the raw data that all other object types display and manage. Data in tables is stored in *records* (rows) and *fields* (columns).
- ✓ **Queries:** Use *queries* to sort and filter data from one or more tables.
- ✓ **Forms:** Access *forms* are similar to printed fill-in-the-blank forms, but they allow you to view and change data stored in Access tables.
- ✓ **Reports:** *Reports* define how data should be presented on printed pages.
- ✓ **Macros:** *Macros* provide a means of automating certain aspects of Access without programming in VBA.
- ✓ **Modules:** The *Modules* group, as you soon discover, is one of the places where you store VBA code. If you're not already familiar with modules, that's fine. Modules are what this book is really all about.

One of the most important things to understand is that you don't use VBA "instead of" other objects, like tables and forms. You use VBA to *enhance* the capabilities of other object types. Therefore, it makes no sense to even try VBA until you have a firm grasp of the purpose and capabilities of those other object types in Access.

## Understanding VBA

Visual Basic is a programming language — a language for writing instructions that a computer can read and process. VBA is a programming language that's specifically designed to work with the application programs in Microsoft Office including Word, Excel, Outlook, and, of course, Access.

When you write text in a programming language (as opposed to writing in plain English), you're writing *code*. Programmers use the term *code* to refer to anything that's written in a computer programming language. For example, Figure 1-2 shows some sample VBA code. The whole trick to mastering VBA is finding out what all the various words in the language mean so that you can write code that tells Access exactly how to perform a task.

```
Public Function PCase(anyText)
    'Custom Access VBA function to fix all uppercase letters.

    PCase = StrConv(anyText, vbProperCase)

    If Left(PCase, 4) = "P.O." Then
        PCase = "P.O." & Mid(PCase, 5)
    End If

    If Left(PCase, 2) = "Mc" Then
        PCase = "Mc" & UCase(Mid(PCase, 3, 1)) & Mid(PCase, 4)
    End If

    If Left(PCase, 3) = "Mac" Then
        PCase = "Mac" & UCase(Mid(PCase, 4, 1)) & Mid(PCase, 5)
    End If

End Function
```

**Figure 1-2:**  
Some  
sample VBA  
code.

If the sample code shown in Figure 1-2 looks like meaningless gibberish to you, don't worry about it. People aren't born knowing how to read and write VBA code. Programming (writing code) is a skill you have to learn. For now, it's sufficient just to know what code looks like. Knowing what the code means is one of the skills you master in this book.

Because VBA code looks like a bunch of meaningless gibberish typed on a sheet of paper, it begs the question of why anybody would want to figure out how to read and write a dreadful language like that one. The answer to that question lies in the role that VBA plays in an application like an Access database.

## Do, not die

Think of the term *execute* in the sense of “to carry out,” as when you execute a U-turn or execute a procedure. Don’t think of *execute* in the sense of “terminate the life of.”

Access does indeed have a ton of tools that let you create a database without any programming. You could easily spend months or years just finding all the things you can do in Access without writing any VBA code. Yet despite the huge number of things you can do without programming, sometimes you want your database to accomplish a task that’s not built into Access. That’s where VBA comes in. When you want Access to perform a task that it doesn’t already know how to perform, you write the steps to be performed in the VBA programming language.

When you’re writing VBA code or just looking at some VBA code written by someone else, Access doesn’t do anything. Access doesn’t start performing the steps described by that code until Access executes the code. When you write VBA code, you’re writing a set of instructions that Access can perform at any time, over and over again.

The ability to use the same code over and over again is the key to automating mundane tasks in Access. For example, if you use Access to print checks, you might have to manually type the part of the check where you spell out the amount, like “Ninety-two and 99/100 Dollars” for \$92.99 because Access can’t make that translation on its own. But if you could write some code to translate a number like \$92.99 into words, you wouldn’t need to type all those dollar amounts. Access would just print the correct information as it prints each check.

## Seeing Where VBA Lurks

In an Access database, VBA code is stored in modules. Despite its fancy name, a *module* is basically an electronic sheet of paper on which VBA code is typed. A module in Access is either of these two types:

- ✓ **Standard:** A page that contains VBA code that’s accessible to all objects in the database. A standard module always exists in the Modules group in the Navigation pane.
- ✓ **Class:** A page of VBA code that’s attached to every form and report you create. You can also create a class module that appears in the Navigation pane.
