Kontogeorgis, Georgios M.

Thermodynamic models for industrial applications: from classical and advanced mixing rules to association theories / Georgios M. Kontogeorgis, Georgios K. Folas.

p. cm.

Includes bibliographical references and index.

ISBN 978-0-470-69726-9 (cloth)

1. Thermodynamics-Industrial applications. 2. Chemical engineering. I. Kontogeorgis, Georgios M. II. Folas, Georgios K. III. Title.

TP155.2.T45K66 2010 660'.2969-dc22

2009028762

A catalogue record for this book is available from the British Library.

ISBN: 978-0-470-69726-9 (Cloth)

Set in 10/12 pt, Times Roman by Thomson Digital, Noida, India Printed and bound in Great Britain by CPI Antony Rowe Ltd, Chippenham, Wiltshire No man lives alone and no books are written in a vacuum either. Our families especially (in Denmark, The Netherlands and Greece) have deeply felt the consequences of the process of writing this book.

I (Georgios Kontogeorgis) would like to dedicate the book to my wife Olga for her patience, support, love and understanding – especially as, during the period of writing of this book, our daughter, Elena, was born.

I (Georgios Folas) would like to thank Georgios Kontogeorgis for our excellent collaboration in writing this monograph during the past two years. I am grateful to my family and wish to dedicate this book to my wife Athanasia for always inspiring and supporting me.

	5 A	5.3.1 Necessity for three models		116
	5.4	Range of applicability of the LC models		116

#### ix Contents

	5.5	On the theoretical significance of the interaction parameters	123
		5.5.1 Parameter values for families of compounds	123
		5.5.2 One-parameter LC models	123
		5.5.3 Comparison of LC model parameters to quantum chemistry	
		and other theoretically determined values	126
	5.6	LC Models: some unifying concepts	126
		5.6.1 Wilson and UNIQUAC	127
		5.6.2 The interaction parameters of the LC models	128
		5.6.3 Successes and limitations of the LC models	128
	5.7	The group contribution principle and UNIFAC	129
		5.7.1 Why there are so many UNIFAC variants	133
		5.7.2 UNIFAC applications	134
	5.8	Local-compositon-free-volume models for polymers	135
		5.8.1 Introduction	135
		5.8.2 FV non-random-mixing models	137
	5.9	Conclusions: is UNIQUAC the best local compostion model available today?	140
	Appe		147
	Refer	rences	154
5	The l	$EoS/G^E$ mixing rules for cubic equations of state	159
	6.1	General	159
	6.2	The infinite pressure limit (the Huron–Vidal mixing rule)	161
	6.3	The zero reference pressure limit (the Michelsen approach)	163
	6.4	Successes and limitations of zero reference pressure models	165
	6.5	The Wong–Sandler (WS) mixing rule	167
	6.6	$EoS/G^E$ approaches suitable for asymmetric mixtures	168
	6.7	Applications of the LCVM, MHV2, PSRK and WS mixing rules	174
	6.8	Cubic EoS for polymers	181
		6.8.1 High-pressure polymer thermodynamics	181
		6.8.2 A simple first approach: application of the vdW EoS to polymers	182
		6.8.3 Cubic EoS for polymers	184
		6.8.4 How to estimate EoS parameters for polymers	187
	6.9	Conclusions: achievements and limitations of the $EoS/G^E$ models	187
	6.10	Recommended Models – so far	189

### **Preface**

Thermodynamics plays an important role in numerous industries, both in the design of separation equipment and processes as well as for product design and optimizing formulations. Complex polar and associating molecules are present in many applications, for which different types of phase equilibria and other thermodynamic properties need to be known over wide ranges of temperature and pressure. Several applications also include electrolytes, polymers or biomolecules. To some extent, traditional activity coefficient models are being phased out, possibly with the exception of UNIFAC, due to its predictive character, as advances in computers and statistical mechanics favor use of equations of state. However, some of these 'classical' models continue to find applications, especially in the chemical, polymer and pharmaceutical industries. On the other hand, while traditional cubic equations of state are often not adequate for complex phase equilibria, over the past 20–30 years advanced thermodynamic models, especially equations of state, have been developed.

The purpose of this work is to present and discuss in depth both 'classical' and novel thermodynamic models which have found or can potentially be used for industrial applications. Following the first introductory part of two short chapters on the fundamentals of thermodynamics and intermolecular forces, the second part of the book (Chapters 3–6) presents the 'classical' models, such as cubic equations of state, activity coefficient models and their combination in the so-called  $EoS/G^E$  mixing rules. The advantages, major applications and reliability are discussed as well as the limitations and points of caution when these models are used for design purposes, typically within a commercial simulation package. Applications in the oil and gas and chemical sectors are emphasized but models suitable for polymers are also presented in Chapters 4–6.

The third part of the book (Chapters 7–14) presents several of the advanced models in the form of association equations of state which have been developed since the early 1990s and are suitable for industrial applications. While many of the principles and applications are common to a large family of these models, we have focused on two of the models (the CPA and PC–SAFT equations of state), largely due to their range of applicability and our familiarity with them. Extensive parameter tables for the two models are available in the two appendices on the companion website at www.wiley.com/go/Kontogeorgis. The final part of the book (Chapters 15–20) illustrates applications of thermodynamics in environmental science and colloid and surface chemistry and discusses models for mixtures containing electrolytes. Finally, brief introductions about the thermodynamic tools available for mixtures with biomolecules as well as the possibility of using quantum chemistry in engineering thermodynamics conclude the book.

The book is based on our extensive experience of working with thermodynamic models, especially the association equations of state, and in close collaboration with industry in the petroleum, energy, chemical and polymer sectors. While we feel that we have included several of the exciting developments in thermodynamic models with an industrial flavor, it has not been possible to include them all. We would like, therefore, to apologize in advance to colleagues and researchers worldwide whose contributions may not have been included or adequately discussed for reasons of economy. However, we are looking forward to receiving comments and suggestions which can lead to improvements in the future.

The book is intended both for engineers wishing to use these models in industrial applications (many of them already available in commercial simulators, as stand-alone or in CAPE-Open compliant format) and for students, researchers and academics in the field of applied thermodynamics. The contents could also be used in

graduate courses on applied chemical engineering thermodynamics, provided that a course on the fundamentals of applied thermodynamics has been previously followed. For this reason, problems are provided on the companion website at www.wiley.com/go/Kontogeorgis. Answers to selected problems are available, while a full solution manual is available from the authors.

Georgios M. Kontogeorgis Copenhagen, Denmark Georgios K. Folas Amsterdam, The Netherlands

### **About the Authors**

Georgios M. Kontogeorgis has been a professor at the Technical University of Denmark (DTU), Department of Chemical and Biochemical Engineering, since January 2008. Prior to that he was associate professor at the same university, a position he had held since August 1999. He has an MSc in Chemical Engineering from the Technical University of Athens (1991) and a PhD from DTU (1995). His current research areas are energy (especially thermodynamic models for the oil and gas industry), materials and nanotechnology (especially polymers – paints, product design, and colloid and surface chemistry), environment (design CO<sub>2</sub> capture units, fate of chemicals, migration of plasticizers) and biotechnology. He is the author of over 100 publications in international journals and co-editor of one monograph. He is the recipient of the Empirikion Foundation Award for 'Achievements in Chemistry' (1999, Greece) and of the Dana Lim Price (2002, Denmark).

Georgios K. Folas was appointed as technologist in the distillation and thermal conversion department, Shell Global Solutions (The Netherlands) in January 2009. He previously worked as Senior Engineer (Facilities and Flow Assurance) in Aker Engineering & Technology AS (Oslo, Norway). He has an MSc in Chemical Engineering from the Technical University of Athens (2000) and an industrial PhD from DTU (2006), in collaboration with Statoilhydro (Norway). He is the author of 15 publications in international journals and the recipient of the Director Peter Gorm-Petersens Award for his PhD work.

## Acknowledgments

We wish to thank all our students and colleagues and especially the faculty members of IVC-SEP Research Center, at the Department of Chemical and Biochemical Engineering of the Technical University of Denmark (DTU), for the many inspiring discussions during the past 10 years which have largely contributed to the shaping of this book. Our very special thanks go to Professor Michael L. Michelsen for the endless discussions we have enjoyed with him on thermodynamics.

In the preparation of this book we have been assisted by many colleagues, friends, current and former students. Some have read chapters of the book or provided material prior to publication, while we have had extensive discussions with others. We would particularly like to thank Professors J. Coutinho, G. Jackson, I. Marrucho, J. Mollerup, G. Sadowski, L. Vega and N. von Solms, Doctors M. Breil, H. Cheng, Ph. Coutsikos, J.-C. de Hemptinne, I. Economou, J. Gabrielsen, A. Grenner, E. Karakatsani I. Kouskoumvekaki, Th. Lindvig, E. Solbraa, N. Sune, A. Tihic, I. Tsivintzelis and W. Yan, as well as the current PhD and MSc students of IVC-SEP, namely A. Avlund, J. Christensen, L. Faramarzi, F. Leon, B. Maribo-Mogensen and A. Sattar-Dar.

All contributions have been highly valuable and we are deeply grateful for them.

 $T_{m,i}$ melting temperature of the component i, K

reduced temperature  $T_r$ **T**ref reference temperature, K

arbitrary temperature for linear UNIFAC (in the temperature dependency of the  $T_0$ 

energy parameters), see Table 5.7 composition variable or internal energy U

(van der Waals) potential energy  $V_A$ 

reduced volume  $V^{^*}$ hard-core volume

Vvolume

 $V_c$ critical volume  $V_f$   $V_g$   $\bar{V}_i$ free volume

gas volume at STP conditions (= 22 414 cm<sup>3</sup>/mol)

partial molar volume

molar volume (L mol<sup>-1</sup>) or maximum volume occupied by a gas (in adsorption in a solid)

molar volume of ice, 1 mol<sup>-1</sup> van der Waals volume  $V_w$ W(r)cell potential function, J
