About the Author

Rob Huddleston has been developing Web pages and applications since 1994, and has been an instructor since 1999, teaching Web and graphic design to thousands of students. His clients have included the United States Bureau of Land Management, the United States Patent and Trademark Office, the States of California and Nevada and many other federal, city, and county agencies; the United States Army and Air Force; Fortune 500 companies such as AT&T, Bank of America, Wells Fargo, Safeway, and Coca-Cola; software companies including Adobe, Oracle, Intuit, and Autodesk; the University of California, San Francisco State University, and the University of Southern California; and hundreds of small businesses and nonprofit agencies, both in the United States and abroad. Rob is an Adjunct Professor in the Interactive Media program at the Art Institute of California, Sacramento. He is an Adobe Certified Instructor, Certified Expert, and Certified Developer, serves as an Adobe User Group Manager, and has been named as an Adobe Community Professional for his volunteer work answering user questions in online forums. He also helps users as an expert moderator on Adobe's Community Help system. Rob lives in Northern California with his wife and two children.

Rob is the author of *XML: Your visual blueprint for building expert Web sites with XML, CSS, XHTML, and XSLT; HTML, XHTML, and CSS: Your visual blueprint for designing effective Web pages; Master VISUALLY: Dreamweaver CS4 and Flash CS4 Professional; ActionScript: Your visual blueprint for creating interactive projects in Flash CS4 Professional; and the Flash Catalyst CS5 Bible*. You can visit

Rob's blog at www.robhuddleston.com, or follow him on Twitter at twitter.com/robhuddles.

Author's Acknowledgments

Writing is mostly a solitary pursuit, but I wouldn't be able to continue doing it without the unwavering love and support from my wife and best friend, Kelley, and our two beautiful children, Jessica and Xander. I hope you kids enjoy seeing your pictures in the book.

The people at Wiley continue to be a wonderful group with whom to work. Acquisitions editor Aaron Black, who first approached me about this project, provided invaluable insight in getting started and then through some of the project's more trying moments. I was pleased and thankful to work again with project editor Sarah Hellert. Many thanks to tech editor Dennis Cohen and copy editor Scott Tullis for adding their expertise.

Bill Mead introduced me to an exciting new opportunity teaching at the Art Institute, and helped with this book by pointing me to the example used in the section on jQuery. Ted Fitzpatrick and Nolan Erck both helped explain some of the intricacies of the Mac to me. Thank you to each of you for your help and your friendship.

How to Use This Book

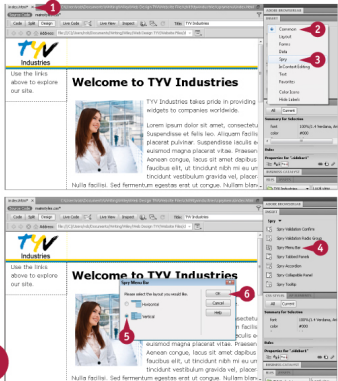

Who This Book Is For

This book is for the reader who has never used this particular technology or software application. It is also for readers who want to expand their knowledge.

The Conventions in This Book

Create a Menu Using Spry

Spry is an Ajax framework from Adobe. Unlike many other frameworks, Spry focuses mostly on visual components and effects, although it does have the ability to read and interpret XML and HTML data files. You can use Spry with almost no code if you use Dreamweaver, because Spry functionality is included directly in the program. However, Adobe does make the Spry framework openly available for anyone to download and use if desired. One of the commonly used Spry widgets is its Menu Bar, which creates an interactive menu with flyout submenus.

- 1 In Dreamweaver, open an existing or new document.
- 2 On the Insert panel, click **Common**.
- 3 Click **Spry**.

The Insert panel opens to show the Spry widgets.

- 4 If necessary, scroll down on the panel and click **Spry Menu Bar**.
- 5 Note: If you are prompted to save your document at this point, click **Yes**.
- 6 Select whether you want a vertical or a horizontal menu (☉ changes to ☐).
- 7 click **OK**.

The menu is added to the page.

- 8 Click **Spry Menu Bar: MenuBar1**.
- 9 The Property Inspector displays the menu bar properties.
- 10 Replace Item 1 with descriptive text.
- 11 Type an address for the Item 1 link.
- 12 If desired, replace 1.1 to 1.3 with descriptive text and appropriate links; you can also use the minus button to remove them.
- 13 Repeat Steps 8 to 10 for the remaining links.

When the page is viewed in a Web browser, you can navigate between the tabs.

TIPS

Can I add more menu items?
Yes. You can click on the blue bar across the top of the tabbed panels widget and then use the Properties panel at the bottom of the screen to add and remove menu and submenu items.

Can I change the appearance of the menus?
Yes. The menu's appearance is completely controlled by CSS. Your CSS Styles panel displays a SpryMenuBar.css document that contains all of the style rules for the widget.

1 Steps

This book uses a step-by-step format to guide you easily through each task. **Numbered steps** are actions you must do; **bulleted steps** clarify a point, step, or optional feature; and **indented steps** give you the result.

2 Notes

Notes give additional information — special conditions that may occur during an operation, a situation that you want to avoid, or a cross reference to a related area of the book.

③ **Icons and Buttons**

Icons and buttons show you exactly what you need to click to perform a step.

④ **Tips**

Tips offer additional information, including warnings and shortcuts.

⑤ **Bold**

Bold type shows command names, options, and text or numbers you must type.

⑥ **Italics**

Italic type introduces and defines a new term.

Chapter 1: The Tools of Web Design and Planning Your Site

Before you can dive into creating Web sites, you need to understand the tools that you need. This chapter shows you the software you need to create Web pages, add images to them, and preview the finished products. However, software alone cannot make a good Web site. You need to carefully plan your site's content, design and overall structure in order to create a site. Therefore, this chapter also details those steps you should undertake to plan your site before you begin building it.

A Brief History of the Web

Only twenty years after its invention, the World Wide Web has become commonplace and has fundamentally changed the way we work, live, and interact with others. However, the medium is in many ways still in its infancy, and as you progress in learning about designing Web pages, you will encounter many significant limitations primarily because the Web was not created as a place to sell books or keep in touch with friends from high school. Understanding why the Web was invented and what its original goals were will help you better understand these issues.

The Invention of the Web

The Web was invented in 1990 by Tim Berners-Lee. Berners-Lee was a physicist at CERN, the European laboratory for particle physics, located in Geneva, Switzerland. Berners-Lee noted that visiting scientists, while working on experiments that could have come straight from *Star Trek*, had to exchange most of their information with one another on paper because their computer systems were incompatible. He therefore created the Web as a way to allow these scientists to share their findings, regardless of what kind of computer system they used.

The Invention of the Internet

Jokes about politicians aside, no one person invented the Internet. Rather, it evolved over decades from a variety of other sources. Much of the early work on what became the Internet was done in the 1960s. Although the United States Department of Defense funded the early research, the Internet was not, contrary to popular belief, designed by or for the military directly.

The Web versus the Internet

Many people confuse the Web with the Internet, but it is important to understand that they are not the same thing. The Web is best thought of as an application that runs on the Internet. E-mail is another application running on the Internet, entirely separate from the Web.

Protocols

Computer networking relies on *protocols*, which are essentially standards by which two computers can talk to one another using a common language. The Internet relies on a suite of two protocols: TCP, or Transmission Control Protocol, and IP, or Internet Protocol. TCP/IP was developed in the 1970s by Robert Kahn and Vinton Cerf. The Web primarily uses the Hypertext Transfer Protocol, or HTTP, developed in 1990 by Tim Berners-Lee.

The Expansion of the Web

CERN did not show much interest in Berners-Lee's invention, and so allowed him to make it publicly available with no licensing restrictions. Soon, scientists at Stanford University and the National Center for Supercomputing Applications took his ideas and began building servers and browsers to work with. Companies soon followed, and by the mid-1990s, the Web had taken off.

The World Wide Web Consortium

In October 1994, Berners-Lee left CERN and founded the World Wide Web Consortium (W3C) as a sort of governing body for the development of the Web. Today, the W3C is still responsible for maintaining and adopting standards for languages such as HTML, or **Hypertext Markup Language**. They also promote standards for other aspects of the Web, such as graphics formats and **cascading style sheets**, or CSS.

The Web Today

Exact numbers are hard to find, but most estimates show that many billions of Web pages are in existence. Search engine Google announced in 2008 that it had indexed one trillion unique Web addresses. Hundreds of millions of Web sites are likely currently in operation. Considering that 2010 marks only the 20th anniversary of the Web, its expansion is truly amazing.

Understanding Browsers

The primary means by which most people access the Web is via a browser. Browsers are simply software applications that read and interpret HTML pages. In a way, you can look at browsers as the canvas for which you design your page. Unfortunately, browsers are inconsistent in the ways in which they display pages, and remain the primary source of Web designers' headaches. Although you can minimize these differences on your pages, understanding browsers is an important first step to learning how to create sites that avoid these issues.

WWW: The First Browser

Tim Berners-Lee developed the first browser when he invented the Web. Although he considered many names for it, he finally settled on WorldWideWeb. His idea was to have browsers/editors, whereby users would rely on a single tool to both view and create pages.
