CONTENTS

Chapter 1 Interchange Reactions in Condensation Polymers and Their Analysis by NMR Spectroscopy

H. R. Kricheldorf, Z. Denchev

| | |
|--|----|
| 1. Introduction | 1 |
| 2. Nuclear magnetic resonance as an analytical tool (^1H , ^{13}C , ^{15}N and ^{29}Si NMR) | 3 |
| 2.1. Basics of the method | 3 |
| 2.2. High resolution NMR of polymers | 16 |
| 3. Interchange reactions involving different functional groups | 32 |
| 3.1. Reactions taking place in polyesters involving ester groups . | 32 |
| 3.2. Reactions taking place in polyamides involving amine and amide groups | 50 |
| 3.3. Interchange reactions involving Si-O bonds | 57 |
| 3.4. Interchange reactions involving urethane and urea groups .. | 66 |
| 4. Concluding remarks | 70 |
| References | 71 |

Chapter 2 Effects of Catalysts in the Reactive Blending of Bisphenol A Polycarbonate with Poly(alkylene terephthalate)s

F. Pilati, M. Fiorini, C. Berti

| | |
|--|----|
| 1. Introduction | 79 |
| 1.1. An outlook on reactive blending of polyesters and polycarbonates | 79 |
| 1.2. Bisphenol A polycarbonate: an overview | 80 |
| 1.3. Poly(alkylene terephthalate)s: an overview | 82 |
| 1.4. Blends of PC and poly(alkylene terephthalate)s: a literature survey | 83 |

| | |
|--|-----|
| 2. Possible reactions occurring during melt-mixing of polyesters and PC | 85 |
| 2.1. Exchange reactions | 86 |
| 2.2. Side reactions | 90 |
| 2.3. Catalyst inhibitors | 91 |
| 3. Evolution of the chemical structure during melt-mixing | 92 |
| 3.1. Approaches to the investigation of the resulting chemical structure | 93 |
| 3.2. Effects of catalysts in the reactive blending of PC/polyester systems | 100 |
| 4. Conclusions | 120 |
| References | 121 |

Chapter 3 Model Studies of Transreactions in Condensation Polymers

J. Devaux

| | |
|--|-----|
| 1. Introduction | 125 |
| 2. Theoretical | 127 |
| 2.1. Microstructure of copolycondensates from transreactions ... | 127 |
| 2.2. Kinetics of transreaction | 133 |
| 3. Application to the PC/PBT system | 136 |
| 3.1. Microstructural study | 136 |
| 3.2. Kinetic study | 139 |
| 3.3. Mechanism of the PC/PBT transcondensation | 143 |
| 4. General discussion and conclusion | 155 |
| References | 157 |

Chapter 4 Copolymer Composition: a Key to the Mechanisms of Exchange in Reactive Polymer Blending

G. Montaudo, C. Puglisi, F. Samperi

| | |
|---|-----|
| 1. Introduction | 159 |
| 2. Exchange mechanisms of reactive polymers in the melt | 161 |
| 3. Exchange reactions occurring by inner-inner mechanism (Case 1) | 165 |
| 3.1. Capped PBT/PC blends | 165 |
| 3.2. Capped PET/PC blends | 170 |
| 4. Exchange reactions occurring by outer-inner mechanisms | 173 |

| | |
|---|-----|
| 4.1. PET/PTX blends (Case 2) | 173 |
| 4.2. PET/PEA blends (Case 3) | 174 |
| 4.3. PBT/PC blends (Case 4) | 180 |
| 4.4. PET/PC blends (Case 4) | 182 |
| 4.5. Nylon 6/PC blends (Case 5) | 183 |
| 5. Conclusions | 189 |
| Appendix | |
| Monte Carlo modelling of exchange reactions | 190 |
| References | 191 |

Chapter 5 Interchain Transesterification Reactions in Copolyesters

J. Economy, L. A. Schneggenburger, D. Frich

| | |
|---|-----|
| 1. Introduction and background | 195 |
| 2. Synthesis and microstructure | 196 |
| 3. Randomisation processes | 201 |
| 4. Sequence ordering | 205 |
| 5. Adhesive bonds in polyesters formed by ITR | 209 |
| 5.1. Liquid-crystalline copolyesters | 209 |
| 5.2. ITR in thermosetting polyesters | 211 |
| 6. Mechanism of adhesive bond formation | 214 |
| References | 216 |

Chapter 6 Inhibition of Transreactions in Condensation Polymers

N. R. James, S. S. Mahajan, S. Sivaram

| | |
|---|-----|
| 1. Introduction | 219 |
| 1.1. Polymer blends | 219 |
| 1.2. Reactive compatibilisation | 221 |
| 1.3. Transreaction during melt-blending | 221 |
| 2. Control of transesterification in polyester blends | 226 |
| 2.1. Introduction | 226 |
| 2.2. Inhibitors for transreaction in polyester and polycarbonate blends | 227 |
| 3. Methods of analysing transreactions in polymer blends | 233 |
| 3.1. IR spectroscopy | 233 |

| | |
|--|-----|
| 3.2. NMR spectroscopy | 239 |
| 3.3. Differential scanning calorimetry | 250 |
| 3.4. Size-exclusion chromatography | 262 |
| 4. Conclusions | 263 |
| References | 263 |

Chapter 7 **Reactive Melt Processing of Aliphatic/Aromatic Polyamide Blends: Effect on Molecular Structure, Semicrystalline Morphology and Thermal Properties**

K. L. L. Eersels, A. M. Aerdts, G. Groeninckx

| | |
|--|-----|
| 1. General introduction | 267 |
| 2. Influence of the processing conditions on the thermal behaviour of PA 46/PA 6I blends | 269 |
| 2.1. Introduction | 269 |
| 2.2. Coprecipitation <i>versus</i> melt-mixing | 273 |
| 2.3. Influence of processing conditions | 275 |
| 3. Influence of the blend composition on the thermal behaviour of PA 46/PA 6I blends | 278 |
| 3.1. Crystallisation and melting behaviour | 278 |
| 4. Molecular characterisation of PA 46/PA 6I blends by means of ¹³ C NMR | 281 |
| 4.1. Theoretical considerations | 283 |
| 4.2. Crystallisation behaviour of PA 46/PA 6I copolymers, prepared by melt-blending, as a function of the extrusion temperature, extrusion time, and blend composition | 287 |
| 4.3. Molecular structure of PA 46/PA 6I copolymers, prepared by melt-blending, as a function of the extrusion temperature, extrusion time, and blend composition | 289 |
| 5. Characterisation of transamidation reactions in PA 46/PA 6I blends using gradient elution chromatography | 293 |
| 5.1. Influence of melt-blending conditions on the degree of transamidation | 295 |
| 5.2. Influence of end-groups on the degree of transamidation | 301 |
| 6. Morphological structure of melt processed PA 46/PA 6I blends .. | 302 |
| 6.1. Semicrystalline morphology of melt processed PA 46/PA 6I blends | 302 |
| 6.2. Relation between the crystalline morphology and the melting behaviour of the PA 46/PA 6I copolymers | 311 |

| | |
|------------------------------|-----|
| 7. General conclusions | 312 |
| References | 315 |

Chapter 8 Sequential Reordering in Condensation Copolymers

S. Fakirov, Z. Denchev

| | |
|--|-----|
| 1. Evidence of the occurrence of chemical interactions in blends of condensation polymers | 319 |
| 1.1. Evidence derived from the behaviour of the crystalline phase | 321 |
| 1.2. Evidence derived from the behaviour of the amorphous phases | 324 |
| 1.3. Evidence derived from the behaviour of crystalline and amorphous phases | 324 |
| 1.4. Evidence derived from chromatographic methods | 329 |
| 2. Melting-induced sequential reordering in condensation copolymers | 331 |
| 2.1. Melting-induced sequential reordering in condensation copolymers obtained from blends of immiscible partners | 333 |
| 2.2. Melting-induced sequential reordering in condensation copolymers obtained from blends of miscible partners | 342 |
| 3. Crystallisation-induced sequential reordering in condensation copolymers | 347 |
| 3.1. Evidence of crystallisation-induced reordering derived from the crystalline phase behaviour | 348 |
| 3.2. Evidence of crystallisation-induced reordering derived from the amorphous phase behaviour | 359 |
| 4. Miscibility-induced sequential reordering in condensation copolymers obtained from miscible and immiscible partners | 364 |
| 4.1. Background | 364 |
| 4.2. Experimental observations | 365 |
| 4.3. Models and thermodynamic considerations | 369 |
| 5. Study of the sequential order in condensation copolymers by means of size exclusion chromatography after selective degradation | 373 |
| 5.1. Basics of the SEC technique | 374 |
| 5.2. Selective degradation of PC-containing condensation copolymers | 377 |
| 5.3. Sequence length determination in poly(ethylene terephthalate) – bisphenol A polycarbonate random copolymers as revealed by combined NMR and SEC studies | 378 |
| 6. Conclusions | 385 |
| References | 386 |

Chapter 9 X-ray Analysis of Transesterification in Blends of Thermotropic Copolyesters

J. Blackwell, C. M. McCullagh

| | |
|---|-----|
| 1. Introduction | 391 |
| 2. Scattering by aperiodic polymer chains | 395 |
| 3. X-ray analysis of copolyester blends | 396 |
| 4. Kinetics of transesterification | 402 |
| 4.1. Random transesterification | 403 |
| 4.2. Transesterification kinetics | 405 |
| 5. Conclusions | 408 |
| References | 409 |

Chapter 10 Effects of Transreactions on the Compatibility and Miscibility of Blends of Condensation Polymers

M. Xanthos, H. Warth

| | |
|--|-----|
| 1. Principles of blend compatibilisation | 411 |
| 2. Transreactions applied to blend compatibilisation | 412 |
| 3. Transreactions applied to specific binary blends | 416 |
| 3.1. Polyester/polyester blends | 416 |
| 3.2. Polyamide/polyamide blends | 422 |
| 3.3. Polyamide/polyester blends | 423 |
| References | 424 |

Chapter 11 Effect of Transreactions and Additional Condensation on Structure Formation and Properties of Condensation Polymers

F. J. Baltá Calleja, S. Fakirov, H. G. Zachmann

| | |
|--|-----|
| 1. Relationship between interchain reactions and structure of condensation polymers | 429 |
| 1.1. Effect of interchain reactions on structure formation and properties of condensation polymers | 429 |
| 1.2. Structure formation in blends of condensation polymers with interchain reactions occurring to various extents | 433 |

| | |
|--|-----|
| 1.3. Effect of polymer structure and morphology on chemical interactions in condensation polymers | 443 |
| 2. Chemical interactions on the interfaces and interphases of condensation polymers | 445 |
| 2.1. Homochemical healing | 445 |
| 2.2. Heterochemical healing and healing with coupling agents ... | 448 |
| 2.3. Chemical healing in crosslinked polyamides | 449 |
| 2.4. Transreactions at the phase boundary of semisolid blends of condensation polymers | 450 |
| 2.5. Chemically released diffusion <i>via</i> transreactions in condensation polymers | 452 |
| 3. Effect of interchain reactions in condensation polymers on their mechanical properties | 453 |
| 3.1. Mechanical properties as revealed by tensile experiments ... | 453 |
| 3.2. Mechanical properties as revealed by microhardness | 455 |
| 4. Some practical aspects of the chemical interactions in condensation polymers | 467 |
| 4.1. Copolycondensates resulting from solid-state additional condensation | 467 |
| 4.2. Copolycondensates resulting from transreactions in the melt | 467 |
| 4.3. Compatibilisation by means of interchange reactions | 468 |
| 4.4. Preparation of laminates from films of condensation polymers by means of interchain reactions | 468 |
| 4.5. Upgrading of molecular weight of condensation polymers by means of additional condensation in the solid state | 469 |
| 4.6. Recycling of condensation polymers by means of interchain reactions | 470 |
| 4.7. Improvements of the finished-product properties | 472 |

| Subject index | 483 |

This Page Intentionally Left Blank

Preface

An inherent property of condensation polymers, in contrast to polyolefins, is their ability to react with each other. Regardless of the mechanism of the chemical reactions during polymer synthesis, the presence of groups of ester, amide, urethane, and other similar types, as well as carboxylic, amine, *etc.*, groups in the macromolecules makes the post reactions possible.

The practical importance of these reactions was first recognised by Flory, who got his patent in 1939 for molecular weight upgrading of polyamide 6 by means of solid state post-condensation. In his fundamental book, he analysed for the first time the constructive and destructive reactions in condensation polymers and their blends. Later, the attention of polymer chemists and physicists was focused on much more attractive problems of polymer science. For the chemists the additional condensation and transreactions seemed to be rather primitive, while physicists hardly knew about their existence, although they always took place during such a “purely” physical treatment as annealing at temperatures close to melting. These reactions attracted again the attention of polymer scientists by the start of intensive studies of polymer blends. It turned out that immiscibility and incompatibility could be overcome to a great extent by producing thin copolymer layers at the interface of blends of condensation polymers, mostly *via* transreactions.

The ability of condensation polymers to undergo additional chemical reactions is fascinating. These reactions allow one (i) to prepare novel copolymers with desired composition and sequential order, as well as to enhance compatibility, (ii) to obtain more uniform polymers by minimising molecular weight fluctuations in a melt stream during polycondensation and processing and (iii) to provide for chemical healing of laminates of condensation polymers.

A good friend of mine, who is a polymer physicist with world-wide reputation, does not believe that transreactions really exist. When, by chance, I told this to another common friend, who is a famous polymer chemist, his reaction was, “Tell him that Professor Flory, with whom he worked so many years, would be very unhappy if he could hear his statement”. As a matter of fact, this was the first very strong impulse for starting this project.

In the present book, the term condensation polymers is used as solely referring to the type of heterochain macromolecules regardless of the chemical mechanism and of the way of their preparation, *e.g.*, by means of additional polymerisation or condensation polymerisation (polycondensation). Although attention is focused mainly on transreactions, additional condensation is also discussed in some chapters since both types of reactions take place simultaneously, particularly under vacuum. Chemical reactions of the destructive type are beyond the scope of this book. It should be mentioned also that the good intention of the Editor to introduce more or less uniform terminology, in the description of the reactions under consideration, failed because the preference of one or another term for the same reaction, expressed by some authors, was too strong.

An international team of polymer chemists and physicists experienced in the field tried to cover the main topics related to the chemical interactions in condensation polymers. As Editor, I enjoyed the work with the individual contributors and gratefully appreciate their support, prompt response and patience. My thanks are also extended to the Institute for Structure of the Matter, Madrid, for the hospitality during my sabbatical tenure offered by DGICYT, Spain, where this project was finalised. I am greatly indebted to my coworker Mrs. S. Petrovich for her everyday help.

Madrid, Dezember 1998

S. Fakirov
Editor

SYMBOLS USED IN THIS BOOK

| Symbol | Definition |
|--------------------------------|--|
| a, b | initial molar fractions of polycondensates 1 and 2 |
| A | absorbance |
| $[A]$ | concentration of low molecular weight species |
| B | degree of randomness |
| B | term accounting for adsorption and other enthalpic processes in SEC column |
| c_A, c_B | molar fraction of comonomer A or B in copolymer |
| C_1 | constant |
| ΔC_{pi} | difference in specific heats between the liquid and glassy states of component i |
| d | spacing of crystal planes |
| d | diagonal length of indentation |
| $d_{(hkl)}$ | spacing of (hkl) planes |
| D | polydispersity index |
| DP | degree of polymerisation |
| e_{HOM} | molar fraction of homopolymers |
| E | energy |
| E | elastic modulus |
| E' | storage modulus |
| E'' | loss modulus |
| f | atomic scattering factor |
| $f_{A_i B_j A_k}$ | molar fraction of triad $A_i B_j A_k$ with B_j as the central unit |
| $f_{\text{BB}}, f_{\text{BN}}$ | molar fraction of BB or BN dyad |
| F | SEC mobile phase volume flow rate |
| F | force applied by indenter |
| F_{A_i} | molar fraction of structural unit A_i |
| $F_{A_i B_j}$ | molar fraction of an $A_i B_j$ dyad in a polymer |
| $F_{jk}(Z)$ | Fourier transform of cross-convolution of monomer j with monomer k |
| F_n | frequency of nucleus n |
| F_n | frequency of block length n |
| G | crystal growth; modified Avrami parameter for microhardness |

| Symbol | Definition |
|------------------|--|
| G'' | loss modulus |
| $G(n_{cyc})$ | probability of formation of a polymer having n_{cyc} units |
| h | Planck's constant |
| H | microhardness |
| H | microhardness (or hardness) of crystallised sample |
| ΔH | transition enthalpy |
| ΔH | reaction heat |
| ΔH | enthalpy of melting |
| H_a | microhardness of quenched amorphous sample |
| $H_{a,i}$ | microhardness of fully amorphous powder |
| H_c | enthalpy of crystallisation |
| H_c | hardness of crystals |
| ΔH_c | enthalpy of crystallisation |
| ΔH_f | molar heat of fusion |
| H_i^{\max} | microhardness of fully crystallised powder |
| H_{loc} | local magnetic field experienced by a nucleus |
| H_m | enthalpy of melting |
| H_m, H_M | microhardness of minor and major components of blend |
| H^{\max} | maximum microhardness |
| H_m° | melting enthalpy of a perfect infinite crystal |
| H^{BL} | microhardness of coreactive PC/PET blend |
| H^{PC} | microhardness of homo PC |
| ΔH_u | molar heat of melting of crystalline units A at T_m° |
| H_0 | static magnetic field |
| H_1 | rotating magnetic field orthogonal to H_0 |
| I | spin angular momentum quantum number |
| I_A, I_{AA} | signal intensity of A–A bond |
| $I_{A'}, I_{AB}$ | signal intensity of A–B bond |
| I_B, I_{BB} | signal intensity of B–B bond |
| $I(Z)$ | scattering along chain axis direction |
| ${}^x J$ | strength of scalar coupling between coupled nuclei with x intervening bonds |
| k | Boltzmann's constant |
| k | monomeric transesterification rate |
| k, k_{AB} | monomer ratio A/B in A–B copolymer |
| k_2 | transreaction rate constant |
| k_n | reaction rate |
| K | equilibrium constant |
| K | geometrical factor |
| K | Mark–Houwink coefficient of PS standard |
| K_s | Mark–Houwink coefficient of sample |
| K_{SEC} | ratio of average solute concentration inside pores to that outside the pores (SEC) |

| Symbol | Definition |
|----------------------------|---|
| l_c | lamellar thickness |
| L | total number of units in sample |
| L | long period or spacing (SAXS measurements) |
| \mathbf{L} | torque |
| \bar{L}_A | average length of block A |
| \bar{L}_{nS} | number-average sequence length of an S unit |
| \bar{L}_{nT} | number-average sequence length of a T unit |
| m | magnetic quantum number |
| m | average length of polymer unit, or aliphatic polymer unit |
| m | parameter describing internal mobility of groups in a single chain |
| M | molecular weight |
| M_{jk} | molar fraction of k in completely random copolymer of monomers j and k , modified for non-randomness if necessary |
| M_n | number-average molecular weight |
| \bar{M}_n | number-average molecular weight |
| M_w | weight-average molecular weight |
| \bar{M}_w | weight-average molecular weight |
| M_z | z -average molecular weight |
| n | repetition factor; $n(x + y) =$ degree of polymerisation |
| n | average degree of polymerisation at time t |
| n | average length of aromatic polymer unit |
| n | degree of polymerisation |
| n | number of ester linkages |
| n | Avrami exponent for microhardness |
| n_0 | average degree of polymerisation at time 0 |
| n_1, n_2 | slopes of microhardness <i>vs.</i> time curves |
| $(n_A), (n_B)$ | number-average sequence lengths of comonomers A and B in copolymer |
| n_{cyc} | number of units in a cycle |
| N_+, N_- | population of upper and lower energy states |
| $N_{A_m B_n}$ | number of times an oligomer $A_m B_n$ appears in simulated sample |
| p | number of polymer reactive groups per unit volume |
| p | number of $A_1 B_1$ units on polyamide 46 |
| p_∞ | upper limit of p at infinite concentration |
| p_{AA} | probability of crystallisable homopolymer unit A being followed by another A unit |
| p_j | molar fraction of monomer j |
| P | probability of reaction at a given site |
| $P_{A_i A_j}, P_{A_i B_j}$ | probability of A_i unit being followed by A_j unit, or B_j unit, in copolymer |

| Symbol | Definition |
|-------------------------|---|
| P_S | molar fraction of sebacate |
| P_{ST} | probability of finding a T unit next to an S unit |
| P_T | molar fraction of terephthalate |
| P_{xy} | element in probability matrix for sequence distribution of units x,y |
| q | number of A_2B_2 units in polyamide 46 |
| Q_1 | point at which exchange takes place |
| r | distance between nuclei |
| r | transcondensation ratio |
| r | cross reaction parameter |
| R | gas constant |
| s_A, s_B | molar fraction of comonomer A or B in sample (mixture of comonomers and copolymer) |
| S | number of exchange events per initial molecule |
| ΔS | reaction entropy |
| $\Delta S'$ | entropy increase for randomisation of initial copolymer blend or diblock |
| $\Delta S''$ | entropy increase for randomisation of restored block copolymer |
| t | extrusion time |
| t_1 | evolution period |
| t_2 | acquisition (detection) time |
| t_a | annealing time |
| t_c | crystallisation time |
| $t_{c_1 \rightarrow 2}$ | time at which hardening kinetics change |
| t_m | melt-pressing time |
| t_R | SEC peak elution time |
| T | temperature |
| T_1 | spin-lattice relaxation time (longitudinal relaxation time) |
| T_2 | spin-spin relaxation time (transverse relaxation time) |
| T_a | annealing temperature |
| T_b | Brill transition temperature |
| $T_{b,c}$ | Brill transition temperature during cooling from the melt |
| T_c | crystallisation temperature |
| T_{cn} | crystal-nematic transition temperature |
| T_g | glass transition temperature |
| T_g^{BL} | glass transition temperature of coreactive PC/PET blend |
| T_g^i | glass transition temperature of component i |
| T_g^{PC} | glass transition temperature of homo PC |
| T_h | healing temperature |
| T_m | melting point |
| T'_m, T''_m | melting points of less and more perfect crystallites in randomised equimolar PET/PC copolymer, respectively |

| Symbol | Definition |
|------------------|---|
| T_m^* | equilibrium melting temperature of random copolymer |
| T_m^o | equilibrium melting temperature of semicrystalline homopolymer |
| T_M^o | thermodynamic equilibrium melting point |
| V_0 | interstitial liquid volume between SEC packing particles |
| V_{cn} | crystal-nematic transition temperature |
| V_e | elution volume |
| V_i | internal pore volume (SEC) |
| V_k | vector in MOSES program |
| V_R | SEC elution (retention) volume |
| w | molar fraction of one component in copolyester blend |
| w, x, y, z | average lengths of polymer sequences |
| w, x, y, z | average lengths of polymer sequences |
| w_c | degree of crystallinity |
| w_{co} | weight fraction of co-oligomers |
| w_{HA}, w_{HB} | weight fraction of homopolymers A or B |
| w_i | mass fraction of component i |
| w_{PEN} | total concentration of PEN units |
| w_{PET} | concentration of PET units |
| W_i | weight fraction of component i |
| W_k | vector in MOSES program |
| W_n | probability of block length n |
| x | distance from chain ends |
| x | number-average sequence length of A_1B_1 groups |
| x | number of transesterification events |
| x, y | number-average sequence lengths of A_1B and A_2B |
| x, y | fractional contribution of x - or y -mer to molar volume of XY polymer |
| x, y | average lengths of ethylene terephthalate and bisphenol A terephthalate sequences |
| $x_{0,i}$ | nominal concentration of starting material i |
| $x_{0,m}$ | concentration of starting material m of minor nominal concentration |
| x_A | molar fraction of crystallisable units A |
| x_i | concentration of component i in blend |
| x_i | actual volume fraction of component i in blend |
| X | molar fraction of A_1B_2 or A_2B_1 dyads at time t |
| X_e | molar fraction of A_1B_2 or A_2B_1 dyads at equilibrium |
| X_i | molar fraction of component i |
| $Y_0(A), Y_0(B)$ | initial number-average degree of polymerisation of A or B |
| z | distance along chain axis; atomic coordinate along the chain axis direction |
| z_j | monomer j separation |
| Z | reciprocal space coordinate of z |

| Symbol | Definition |
|--------------------------|---|
| α | fraction of minor component m |
| α | Mark-Houwink coefficient of PS standard |
| α_L | linear crystallinity, l_c/L |
| α_s | Mark-Houwink coefficient of sample |
| γ | magnetogyric ratio |
| δ | chemical shift |
| δ^2 | cohesive energy density |
| $\tan \delta$ | loss factor |
| ε | strain |
| ε_0 | initial number of chain ends |
| ε_b | relative elongation at break |
| η^* | viscosity |
| $[\eta]$ | intrinsic viscosity |
| $\langle \eta^2 \rangle$ | invariant in Chapter 7, Eq. (15) |
| η_{int} | intrinsic viscosity |
| θ | angle between magnetic moment μ and applied field H_0 |
| 2θ | scattering angle |
| λ | draw ratio |
| μ | magnetic moment |
| ν | frequency of energy quantum absorbed or emitted by nucleus |
| ν | number of transesterification events per monomer |
| ν_0 | precessional or Larmor frequency |
| ρ_a | electron density of amorphous phase |
| ρ_c | electron density of crystalline phase |
| σ | screening constant |
| σ | normal stress |
| σ_b | stress at break |
| σ_e | fold surface free energy |
| φ | degree of crystallinity |
| χ | degree of randomness |
| Ψ | percentage of transamidation |

Chapter 1

Interchange Reactions in Condensation Polymers and Their Analysis by NMR Spectroscopy

H. R. Kricheldorf, Z. Denchev

1. Introduction

Interchange reactions* are a phenomenon that concerns numerous classes of polymers. Recently, these interactions have been subject to extensive research due to the fact that they open the route to some new methods of polymer modification and even the preparation of novel polymer materials.

Interchange reactions take place at elevated temperatures (most frequently in the melt) between functional groups belonging to molecules with different degrees of polymerisation or different chemical compositions. As a rule, they are reversible equilibrium interactions, typical of polycondensates, and have been recognised since these polymers were first made. Most prominent examples are polyesters and polyamides, where interchange reactions are best studied and understood. However, during recent decades, a number of publications have dealt with interchange reactions that involve urethane and urea groups, Si-O bonds, *etc.*; these also deserve special attention.

*There is a great variety of different terms used in the literature when addressing the interchange reactions, *e.g.*, transreactions, transesterification, ester-ester interchange, *etc.* In this chapter, the general term "interchange reactions" is used consistently. It is classical English, widely accepted and highly versatile.

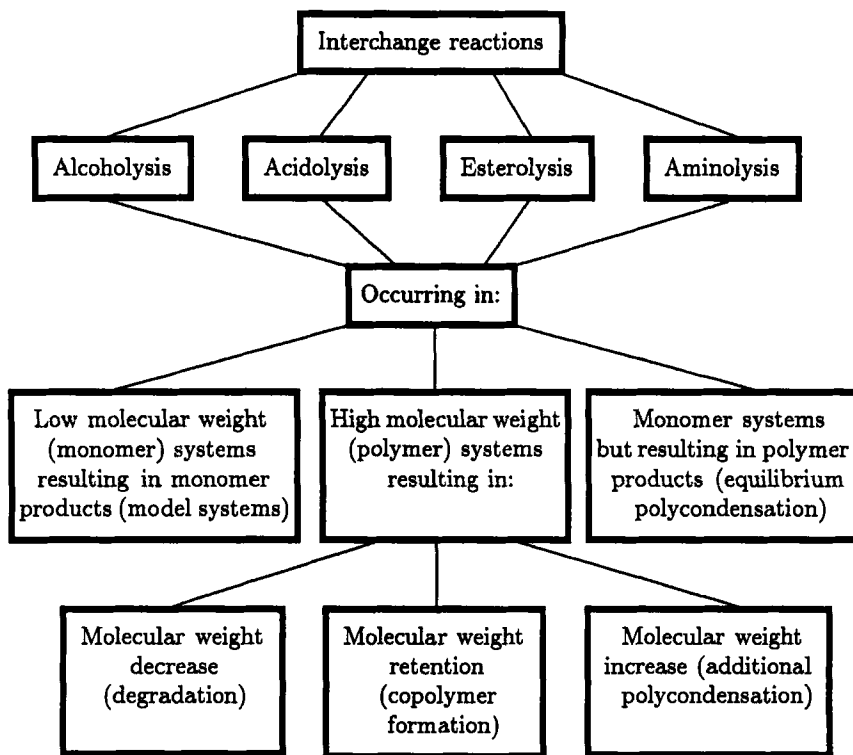

Figure 1. Relationships between interchange reactions

This chapter covers the characteristics of some significant types of interchange reactions, such as acidolysis, alcoholysis, aminolysis, esterolysis, taking place in low or high molecular weight systems and resulting in different products — low molecular weight compounds, homo- or copolymers. The scheme in Figure 1 depicts the mutual connections and relations between all the types of interchange reaction. However, this classification is quite superficial: for instance, when discussing the interchange reactions in polymer systems, attention is focused on copolymer formation, although it is clear that, depending on the conditions of treatment and chemical composition of the blend constituents, the process should be accompanied by either degradation or additional polycondensation. These three processes are closely connected and should be considered as inevitable parts of the condensation equilibrium.

It is worth noting that there had been some indications that interchange reactions might be possible in some carbochain polymers (*i.e.*, with all-carbon backbones). These also result in polymer modification, but occur to a much lesser degree. For this reason they are treated as secondary

reactions, taking place during the polyaddition [1,2], and are beyond the scope of this chapter.

Very often it is of prime importance to discover the effect of the interchange reactions on the microstructure of the respective system — for instance, to find out whether or not a copolymer is formed as a result of interchange reactions in monomer or polymer systems, or to determine the sequence length distribution, *etc.* High resolution nuclear magnetic resonance (NMR) has proved to be the most useful method for the direct experimental determination of the polymer microstructure. Of the two nuclei ^1H and ^{13}C , which possess spin and are common in synthetic polymers, ^1H initially served as the spin probe in NMR polymer studies. However, though ^1H is more abundant than ^{13}C , proton NMR spectra of synthetic polymers suffer from a narrow dispersion of chemical shifts and extensive ^1H - ^1H spin coupling. ^{13}C NMR, as currently practiced, does not suffer from these difficulties, of which the latter has recently been turned to advantage for ^1H NMR by 2D techniques. The advent of proton-decoupled spectra recorded in Fourier-transform mode has quickly made ^{13}C NMR spectroscopy the method of choice for determining polymer microstructures. Other methods, such as ^{15}N and ^{29}Si NMR, are rapidly gaining importance as irreplaceable tools for the characterisation of siloxanes and N-containing polycondensates. For all these reasons, the basic principles and importance of modern NMR techniques in view of their application for interchange reaction characterisation are discussed in this chapter.

2. Nuclear magnetic resonance as an analytical tool (^1H , ^{13}C , ^{15}N and ^{29}Si NMR)

2.1. *Basics of the method*

NMR spectroscopy belongs among the radiospectroscopic methods, where the basic transitions are those between spin (or magnetic) energy levels of the nuclei. In contrast to the optical transitions (*e.g.*, vibrational, rotational, electronic), the nucleus can absorb radiofrequencies only if the molecules are placed in a strong, external magnetic field. This is because in the absence of magnetic field, the different spin states of the nuclei have the same energy, *i.e.*, they are degenerate.

2.1.1. *Magnetic properties of the nucleus*

While the nuclei of all atoms possess charge and mass, not every nucleus has angular momentum and a magnetic moment. Nuclei with odd mass numbers have spin angular momentum quantum numbers I , with values that are odd-integral multiples of $1/2$. Nuclei with even mass numbers are spinless if their nuclear charge is even, and have integral spin I if their nuclear charge is odd.

The angular momentum of a nucleus with spin I is simply $I(h/2\pi)$, where h is Planck's constant. If $I \neq 0$, the nucleus will possess a magnetic moment, μ , which is taken parallel to the angular-momentum vector. A set of magnetic quantum numbers m , given by the series

$$m = I, I - 1, I - 2, \dots, -I \quad (1)$$

describes the values of the magnetic moment vector which are permitted along any chosen axis. For nuclei of interest here (^1H , ^{13}C , ^{15}N , ^{19}F , ^{29}Si , ^{31}P), $I = 1/2$, and thus $m = +1/2$ and $-1/2$. In general, there are $2I + 1$ possible orientations of μ , or magnetic states of the nucleus. The ratio of the magnetic moment and the angular momentum is called the magnetogyric ratio, γ :

$$\gamma = 2\pi\mu/hI \quad (2)$$

and is characteristic of a given nucleus.

The nuclei commonly observed in NMR studies of polymers usually have spin $I = 1/2$, and are characterised by $2I + 1 = 2$ magnetic states, $m = +1/2$ and $-1/2$. Both nuclear magnetic states have the same energy in the absence of a magnetic field, but they correspond to states of different potential energy upon application of a uniform magnetic field H_0 . The magnetic moment μ is either aligned along ($m = +1/2$) or against ($m = -1/2$) the field H_0 , with the latter state corresponding to a higher energy. Detection of the transitions of the magnetic nuclei between these spin states [$m = +1/2$ (parallel), $m = -1/2$ (antiparallel)] are made possible by the NMR phenomenon.

Table 1. Magnetic characteristics of some atomic nuclei [3]

| Nucleus | Natural abundance (%) | Atomic number I | Magnetogyric ratio γ (rad.s.Oe) | Magnetic moment μ (magn-tons) | Quadrupole moment Q (10^{-24} cm 2) | Relative amplitude of the signal | Resonance frequency (MHz) |
|--------------------------|-----------------------|-------------------|--|-----------------------------------|--|----------------------------------|---------------------------|
| $^1\text{H}^1$ | 99.98 | 1/2 | 26 753 | 2.79270 | — | 1.000 | 100 |
| $^2\text{H}^1(\text{D})$ | 0.016 | 1 | 4 107 | 0.85738 | 0.00274 | 0.010 | 15.4 |
| $^{11}\text{B}^5$ | 81.17 | 3/2 | 8 583 | 2.6880 | 0.0355 | 0.165 | 32.2 |
| $^{12}\text{C}^6$ | 98.89 | 0 | — | — | — | — | — |
| $^{13}\text{C}^6$ | 1.11 | 1/2 | 6 728 | 0.70216 | — | 0.016 | 25.1 |
| $^{14}\text{N}^7$ | 99.64 | 1 | 1 934 | 0.40357 | 0.02 | 0.001 | 7.2 |
